

第十一章曲线积分与曲面积分练习题（五）17-23 题解答

一、斯托克斯公式

定理：设 C 是分段光滑有向闭曲线， Σ 是 C 为边界的任一分片光滑有向曲面， C 的方向与 Σ 的方向符合右手螺旋法则，函数 $P(x, y, z), Q(x, y, z), R(x, y, z)$ 在包含 Σ 的某区域内有连续偏导数，则有斯托克斯公式

$$\begin{aligned} & \oint_C P(x, y, z)dx + Q(x, y, z)dy + R(x, y, z)dz \\ &= \iint_{\Sigma} \left(\frac{\partial R}{\partial y} - \frac{\partial Q}{\partial z} \right) dydz + \left(\frac{\partial P}{\partial z} - \frac{\partial R}{\partial x} \right) dzdx + \left(\frac{\partial Q}{\partial x} - \frac{\partial P}{\partial y} \right) dxdy \end{aligned}$$

或

$$\begin{aligned} & \oint_C P(x, y, z)dx + Q(x, y, z)dy + R(x, y, z)dz \\ &= \iint_{\Sigma} \left[\left(\frac{\partial R}{\partial y} - \frac{\partial Q}{\partial z} \right) \cos \alpha + \left(\frac{\partial P}{\partial z} - \frac{\partial R}{\partial x} \right) \cos \beta + \left(\frac{\partial Q}{\partial x} - \frac{\partial P}{\partial y} \right) \cos \gamma \right] dS \end{aligned}$$

其中 $\cos \alpha, \cos \beta, \cos \gamma$ 是有向曲面 Σ 的法向量的方向余弦。

注：斯托克斯公式还可以写成

$$\begin{aligned} & \oint_C P(x, y, z)dx + Q(x, y, z)dy + R(x, y, z)dz \\ &= \iint_{\Sigma} \begin{vmatrix} dydz & dzdx & dxdy \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ P & Q & R \end{vmatrix} = \iint_{\Sigma} \begin{vmatrix} \cos \alpha & \cos \beta & \cos \gamma \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ P & Q & R \end{vmatrix} dS \end{aligned}$$

二、空间曲线积分与路径无关条件

定理：设函数 $P(x, y, z), Q(x, y, z), R(x, y, z)$ 在曲面单连通区域 G 内具有连续偏导数，

则下列四个命题等价：

(1) 在 G 内，曲线积分

$$\int_{\widehat{AB}} Pdx + Qdy + Rdz \quad (\vec{F} = P\vec{i} + Q\vec{j} + R\vec{k} \text{ 为保守场})$$

与路径无关（仅与起点 A 和终点 B 有关）；

(2) 在 G 内，对任一分段光滑曲线 C ，积分

$$\oint_C Pdx + Qdy + Rdz = 0$$

(3) 在 G 内，表达式 $Pdx + Qdy + Rdz$ 是某函数 $u(x, y, z)$ 的全微分，即

$$du = Pdx + Qdy + Rdz \quad (\text{或 } \text{grad } u = \vec{F}, \vec{F} \text{ 为梯度场或有势场})$$

(4) 在 G 内, 恒有

$$\frac{\partial R}{\partial y} = \frac{\partial Q}{\partial z}, \frac{\partial P}{\partial z} = \frac{\partial R}{\partial x}, \frac{\partial Q}{\partial x} = \frac{\partial P}{\partial y} \quad (\text{rot } \vec{F} = \vec{0}, \vec{F} \text{ 为无旋场})$$

注: 若 $du = Pdx + Qdy + Rdz$ 或 $\text{grad } u = P\vec{i} + Q\vec{j} + R\vec{k}$, 则全体原函数为

$$u(x, y, z) = \int_{(x_0, y_0, z_0)}^{(x, y, z)} P(x, y, z)dx + Q(x, y, z)dy + R(x, y, z)dz + C$$

三、空间曲线积分基本公式

设 $du = Pdx + Qdy + Rdz$ 或 $\text{grad } u = P\vec{i} + Q\vec{j} + R\vec{k}$, 则

$$\int_{\widehat{AB}} Pdx + Qdy + Rdz = \int_A^B Pdx + Qdy + Rdz = u \Big|_A^B$$

四、旋度计算公式

设有连续可微向量场 $\vec{F} = P(x, y, z)\vec{i} + Q(x, y, z)\vec{j} + R(x, y, z)\vec{k}$, 则其旋度为

$$\text{rot } \vec{F} = \begin{vmatrix} \vec{i} & \vec{j} & \vec{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ P & Q & R \end{vmatrix} = \left(\frac{\partial R}{\partial y} - \frac{\partial Q}{\partial z} \right) \vec{i} + \left(\frac{\partial P}{\partial z} - \frac{\partial R}{\partial x} \right) \vec{j} + \left(\frac{\partial Q}{\partial x} - \frac{\partial P}{\partial y} \right) \vec{k}$$

17. 计算 $I = \oint_C ydx + zdy + xdz$, 其中 $C: \begin{cases} x^2 + y^2 + z^2 = 2az \\ x + z = a \end{cases} (a > 0)$, 从 z 轴

正向看去, C 是逆时针方向的.

解 方法一、(利用斯托克斯公式, 第二型曲面积分形式)

取 Σ 为平面 $x + z = a$ 被曲线 C 所围部分的上侧 (也可以取 Σ 为球面 $x^2 + y^2 + z^2 = 2az$ 被曲线 C 所围部分的上侧, 但计算较复杂), 则

$$\Sigma: z = a - x, (x, y) \in D_{xy}, \text{ 上侧}$$

其中 $D_{xy}: 2x^2 + y^2 \leq a^2$, 由斯托克斯公式得

$$\begin{aligned}
I &= \oint_C ydx + zdy + xdz = \iint_{\Sigma} \begin{vmatrix} dydz & dzdx & dxdy \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ y & z & x \end{vmatrix} \\
&= \iint_{\Sigma} -dydz - dzdx - dxdy = \iint_{D_{xy}} \left[-(-1) \cdot \frac{\partial z}{\partial x} - (-1) \cdot \frac{\partial z}{\partial y} - 1 \right] dxdy \\
&= \iint_{D_{xy}} [-(-1) \cdot (-1) - (-1) \cdot 0 - 1] dxdy = -2 \iint_{D_{xy}} dxdy \\
&= -2 \cdot \pi \cdot \frac{a}{\sqrt{2}} \cdot a = -\sqrt{2}\pi a^2
\end{aligned}$$

方法二、(利用斯托克斯公式，第一型曲面积分形式)

取 Σ 为平面 $x + z = a$ 被曲线 C 所围部分的上侧 (也可以取 Σ 为球面 $x^2 + y^2 + z^2 = 2az$ 被曲线 C 所围部分的上侧，但计算较复杂)，则其法向量为

$$\vec{n} = (1, 0, 1)$$

其单位法向量为

$$\vec{n}^0 = \frac{\vec{n}}{|\vec{n}|} = \frac{(1, 0, 1)}{\sqrt{1^2 + 0^2 + 1^2}} = \left(\frac{1}{\sqrt{2}}, 0, \frac{1}{\sqrt{2}} \right)$$

所以

$$\cos \alpha = \frac{1}{\sqrt{2}}, \cos \beta = 0, \cos \gamma = \frac{1}{\sqrt{2}}$$

由斯托克斯公式得

$$\begin{aligned}
I &= \oint_C ydx + zdy + xdz = \iint_{\Sigma} \begin{vmatrix} \frac{1}{\sqrt{2}} & 0 & \frac{1}{\sqrt{2}} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ y & z & x \end{vmatrix} dS \\
&= \iint_{\Sigma} \left(-\frac{1}{\sqrt{2}} - 0 - \frac{1}{\sqrt{2}} \right) dS = -\sqrt{2} \iint_{\Sigma} dS = -\sqrt{2} \cdot \pi a^2 = -\sqrt{2}\pi a^2 \\
&\quad \left(\text{注意到曲线 } C \text{ 为过球心的大圆，所以 } \iint_{\Sigma} dS = \pi a^2 \right)
\end{aligned}$$

方法三、(将空间曲线积分化为平面曲线积分，然后用格林公式化为二重积分计算)

若 C_{xy} 记为曲线 C 在 xOy 平面上的投影曲线，则

$$C_{xy} : 2x^2 + y^2 = a^2, \text{ 逆时针}$$

由 $x + z = a$ 可知, $z = a - x, dz = -dx$, 代入曲线积分得

$$\begin{aligned} I &= \oint_C ydx + zdy + xdz = \oint_{C_{xy}} ydx + (a - x)dy + x(-dx) \\ &= \oint_{C_{xy}} (y - x)dx + (a - x)dy = \iint_{D_{xy}} \left[\frac{\partial}{\partial x} (a - x) - \frac{\partial}{\partial y} (y - x) \right] dxdy \\ &= -2 \iint_{D_{xy}} dxdy = -2 \cdot \pi \cdot \frac{a}{\sqrt{2}} \cdot a = -\sqrt{2}\pi a^2 \end{aligned}$$

方法四、(将曲线积分化为定积分进行计算)

由 $x + z = a$ 可知, $z = a - x$, 代入 $x^2 + y^2 + z^2 = 2az$ 得 $2x^2 + y^2 = a^2$,

将其参数化得 $x = \frac{a}{\sqrt{2}} \cos t, y = a \sin t$, 代入 $z = a - x$ 得 $z = a - \frac{a}{\sqrt{2}} \cos t$,

于是 C 的参数方程为

$$C: x = \frac{a}{\sqrt{2}} \cos t, y = a \sin t, z = a - \frac{a}{\sqrt{2}} \cos t, t \text{ 从 } 0 \text{ 到 } 2\pi$$

代入曲线积分得

$$\begin{aligned} I &= \oint_C ydx + zdy + xdz \\ &= \int_0^{2\pi} \left[a \sin t \cdot \left(-\frac{a}{\sqrt{2}} \sin t \right) + \left(a - \frac{a}{\sqrt{2}} \cos t \right) \cdot a \cos t + \frac{a}{\sqrt{2}} \cos t \cdot \frac{a}{\sqrt{2}} \sin t \right] dt \\ &= \int_0^{2\pi} \left(-\frac{a^2}{\sqrt{2}} + a^2 \cos t + \frac{a^2}{2} \sin t \cos t \right) dt = -\sqrt{2}\pi a^2 \end{aligned}$$

18. 计算 $I = \oint_{\Gamma} (y^2 - z^2)dx + (z^2 - x^2)dy + (x^2 - y^2)dz$, 其中 Γ 是用平面

$x + y + z = \frac{3}{2}$ 截立方体 $\Omega: 0 \leq x \leq 1, 0 \leq y \leq 1, 0 \leq z \leq 1$ 的表面所得的截痕,

若从 x 轴的正向看去, Γ 是逆时针方向的.

解 方法一、(利用斯托克斯公式, 第二型曲面积分形式)

取 Σ 为平面 $x + y + z = \frac{3}{2}$ 被曲线 Γ 所围部分的上侧, 则

$$\Sigma: z = \frac{3}{2} - x - y, (x, y) \in D_{xy}, \text{ 上侧}$$

其中 $D_{xy}: 0 \leq x \leq 1, 0 \leq y \leq 1, \frac{1}{2} \leq x + y \leq \frac{3}{2}$, 由斯托克斯公式得

$$\begin{aligned}
I &= \oint_{\Gamma} (y^2 - z^2)dx + (z^2 - x^2)dy + (x^2 - y^2)dz \\
&= \iint_{\Sigma} \begin{vmatrix} dydz & dzdx & dxdy \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ y^2 - z^2 & z^2 - x^2 & x^2 - y^2 \end{vmatrix} \\
&= -2 \iint_{\Sigma} (y+z)dydz + (z+x)dzdx + (x+y)dxdy \\
&= -2 \iint_{D_{xy}} \left[-\left(y + \frac{3}{2} - x - y\right) \cdot \frac{\partial z}{\partial x} - \left(\frac{3}{2} - x - y + x\right) \cdot \frac{\partial z}{\partial y} + (x+y) \right] dxdy \\
&= -2 \iint_{D_{xy}} \left[-\left(y + \frac{3}{2} - x - y\right) \cdot (-1) - \left(\frac{3}{2} - x - y + x\right) \cdot (-1) + (x+y) \right] dxdy \\
&= -6 \iint_{D_{xy}} dxdy = -6 \cdot \left[1^2 - 2 \cdot \frac{1}{2} \cdot \left(\frac{1}{2}\right)^2 \right] = -\frac{9}{2}
\end{aligned}$$

方法二、(利用斯托克斯公式，第一型曲面积分形式)

取 Σ 为平面 $x + y + z = \frac{3}{2}$ 被曲线 Γ 所围部分的上侧，则其法向量为

$$\vec{n} = (1, 1, 1)$$

其单位法向量为

$$\vec{n}^0 = \frac{\vec{n}}{|\vec{n}|} = \frac{(1, 1, 1)}{\sqrt{1^2 + 1^2 + 1^2}} = \left(\frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}} \right)$$

所以

$$\cos \alpha = \frac{1}{\sqrt{3}}, \cos \beta = \frac{1}{\sqrt{3}}, \cos \gamma = \frac{1}{\sqrt{3}}$$

由斯托克斯公式得

$$\begin{aligned}
I &= \oint_{\Gamma} (y^2 - z^2)dx + (z^2 - x^2)dy + (x^2 - y^2)dz \\
&= \iint_{\Sigma} \begin{vmatrix} \frac{1}{\sqrt{3}} & \frac{1}{\sqrt{3}} & \frac{1}{\sqrt{3}} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ y^2 - z^2 & z^2 - x^2 & x^2 - y^2 \end{vmatrix} dS \\
&= -\frac{4}{\sqrt{3}} \iint_{\Sigma} (x + y + z) dS = -\frac{4}{\sqrt{3}} \cdot \frac{3}{2} \iint_{\Sigma} dS = -\frac{4}{\sqrt{3}} \cdot \frac{3}{2} \cdot \frac{3\sqrt{3}}{4} = -\frac{9}{2} \\
&\quad \left(\text{注意到曲线}\Gamma\text{围成正六边形的面积为}\iint_{\Sigma} dS = \frac{3\sqrt{3}}{4} \right)
\end{aligned}$$

方法三、(将空间曲线积分化为平面曲线积分, 然后用格林公式化为二重积分计算)

若 Γ_{xy} 记为曲线 Γ 在 xOy 平面上的投影曲线, 则 Γ_{xy} 是区域

$D_{xy} : 0 \leq x \leq 1, 0 \leq y \leq 1, \frac{1}{2} \leq x + y \leq \frac{3}{2}$ 的正向边界曲线, 由 $x + y + z = \frac{3}{2}$

可知, $z = \frac{3}{2} - x - y, dz = -dx - dy$, 代入曲线积分得

$$\begin{aligned}
I &= \oint_{\Gamma} (y^2 - z^2)dx + (z^2 - x^2)dy + (x^2 - y^2)dz \\
&= \oint_{\Gamma_{xy}} \left(y^2 - \left(\frac{3}{2} - x - y \right)^2 \right) dx + \left(\left(\frac{3}{2} - x - y \right)^2 - x^2 \right) dy + (x^2 - y^2)(-dx - dy) \\
&= \oint_{\Gamma_{xy}} \left[2y^2 - x^2 - \left(\frac{3}{2} - x - y \right)^2 \right] dx + \left[\left(\frac{3}{2} - x - y \right)^2 - 2x^2 + y^2 \right] dy \\
&= \iint_{D_{xy}} \left\{ \frac{\partial}{\partial x} \left[\left(\frac{3}{2} - x - y \right)^2 - 2x^2 + y^2 \right] - \frac{\partial}{\partial y} \left[2y^2 - x^2 - \left(\frac{3}{2} - x - y \right)^2 \right] \right\} dx dy \\
&= \iint_{D_{xy}} \left[-2 \left(\frac{3}{2} - x - y \right) - 4x - 4y - 2 \left(\frac{3}{2} - x - y \right) \right] dx dy \\
&= -6 \iint_{D_{xy}} dx dy = -\frac{9}{2}
\end{aligned}$$

19. 计算 $I = \oint_L (y^2 - z^2)dx + (z^2 - x^2)dy + (x^2 - y^2)dz$, 其中 L 是抛物面

$z = x^2 + y^2$ 与圆柱面 $x^2 + y^2 = 2x$ 的交线, 从 x 轴的正向往负向看, L 是逆时针方向

的.

解 方法一、(利用斯托克斯公式, 第二型曲面积分形式)

由 $z = x^2 + y^2$ 与 $x^2 + y^2 = 2x$ 得 $z = 2x$, 取 Σ 为平面 $z = 2x$ 被曲线 L 所围部

分的下侧 (也可以取 Σ 为曲面 $z = x^2 + y^2$ 被曲线 L 所围部分的下侧), 则

$$\Sigma : z = 2x, (x, y) \in D_{xy}, \text{ 下侧}$$

其中 $D_{xy} : x^2 + y^2 \leq 2x$, 由斯托克斯公式得

$$\begin{aligned} I &= \oint_L (y^2 - z^2)dx + (z^2 - x^2)dy + (x^2 - y^2)dz \\ &= \iint_{\Sigma} \begin{vmatrix} dydz & dzdx & dxdy \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ y^2 - z^2 & z^2 - x^2 & x^2 - y^2 \end{vmatrix} \\ &= -2 \iint_{\Sigma} (y + z)dydz + (z + x)dzdx + (x + y)dxdy \\ &= -2 \cdot (-1) \iint_{D_{xy}} \left[-(y + 2x) \frac{\partial z}{\partial x} - (2x + x) \frac{\partial z}{\partial y} + (x + y) \right] dxdy \\ &= 2 \iint_{D_{xy}} [-(y + 2x) \cdot 2 - (2x + x) \cdot 0 + (x + y)] dxdy \\ &= 2 \iint_{D_{xy}} (-y - 3x) dxdy = -6 \iint_{D_{xy}} x dxdy \\ &= -6 \int_{-\frac{\pi}{2}}^{\frac{\pi}{2}} d\theta \int_0^{2 \cos \theta} r^2 \cos \theta dr = -6\pi \end{aligned}$$

方法二、(将空间曲线积分化为平面曲线积分, 然后用格林公式化为二重积分计算)

若 L_{xy} 记为曲线 L 在 xOy 平面上的投影曲线, 则

$$L_{xy} : x^2 + y^2 = 2x, \text{ 顺时针}$$

由 $z = 2x$ 可知, $dz = 2dx$, 代入曲线积分得

$$\begin{aligned} I &= \oint_L (y^2 - z^2)dx + (z^2 - x^2)dy + (x^2 - y^2)dz \\ &= \oint_{L_{xy}} (y^2 - (2x)^2)dx + ((2x)^2 - x^2)dy + (x^2 - y^2)(2dx) \\ &= \oint_{L_{xy}} (-y^2 - 2x^2)dx + 3x^2dy = -\iint_{D_{xy}} \left[\frac{\partial}{\partial x} (3x^2) - \frac{\partial}{\partial y} (-y^2 - 2x^2) \right] dxdy \\ &= -\iint_{D_{xy}} (6x + 2y) dxdy = -6 \iint_{D_{xy}} x dxdy = -6\pi \end{aligned}$$

方法三、(将曲线积分化为定积分进行计算)

由 $x^2 + y^2 = 2x$ 得 $(x-1)^2 + y^2 = 1$, 将其参数化得
 $x = 1 + \cos t, y = \sin t$, 代入 $z = 2x$ (或代入 $z = x^2 + y^2$) 得 $z = 2 + 2\cos t$,
 于是 L 的参数方程为

$$L: x = 1 + \cos t, y = \sin t, z = 2 + 2\cos t, t \text{ 从 } \pi \text{ 到 } -\pi$$

代入曲线积分得

$$\begin{aligned} I &= \oint_L (y^2 - z^2)dx + (z^2 - x^2)dy + (x^2 - y^2)dz \\ &= \int_{\pi}^{-\pi} \left\{ \sin^2 t - (2 + 2\cos t)^2 \right\} \cdot (-\sin t) + \left[(2 + 2\cos t)^2 - (1 + \cos t)^2 \right] \cdot \cos t \\ &\quad + \left[(1 + \cos t)^2 - \sin^2 t \right] \cdot (-2\sin t) \right\} dt \\ &= \int_{\pi}^{-\pi} \left[(2 + 2\cos t)^2 - (1 + \cos t)^2 \right] \cos t dt = -6\pi \end{aligned}$$

20. 下列曲线积分, 能明确计算的是 ()

- (A) $\int_{(0,0,0)}^{(1,1,1)} y^2 z^3 dx + 2xyz^3 dy + 3xy^2 z^2 dz$; (B) $\int_{(0,0,0)}^{(1,1,1)} yz dx + xy^2 z dy + xyz^2 dz$;
 (C) $\int_{(0,0,0)}^{(1,1,1)} xy dx + yz dy + zxdz$; (D) $\int_{(0,0,0)}^{(1,1,1)} z^2 x dx + 2yz^2 dy + 3xy dz$.

解 (只有曲线积分与路径无关, 带上、下的曲线积分才能明确计算, 在曲面单连通区域内,

$$\text{曲线积分 } \int_{\widehat{AB}} Pdx + Qdy + Rdz \text{ 与路径无关} \Leftrightarrow \frac{\partial R}{\partial y} = \frac{\partial Q}{\partial z}, \frac{\partial P}{\partial z} = \frac{\partial R}{\partial x}, \frac{\partial Q}{\partial x} = \frac{\partial P}{\partial y} \text{ (即}$$

$$\operatorname{rot} \vec{F} = \vec{0} \text{))}$$

对于 $\int_{(0,0,0)}^{(1,1,1)} y^2 z^3 dx + 2xyz^3 dy + 3xy^2 z^2 dz$, 有

$$P = y^2 z^3, Q = 2xyz^3, R = 3xy^2 z^2$$

$$\frac{\partial R}{\partial y} = 6xyz^2 = \frac{\partial Q}{\partial z}, \frac{\partial P}{\partial z} = 3y^2 z^2 = \frac{\partial R}{\partial x}, \frac{\partial Q}{\partial x} = 2yz^3 = \frac{\partial P}{\partial y}$$

连续, 所以选(A).

对于 $\int_{(0,0,0)}^{(1,1,1)} yz dx + xy^2 z dy + xyz^2 dz$, 有

$$P = yz, Q = xy^2 z, R = xyz^2$$

但 $\frac{\partial R}{\partial y} = xz^2 \neq xy^2 = \frac{\partial Q}{\partial z}$, 所以排除(B).

对于 $\int_{(0,0,0)}^{(1,1,1)} xy dx + yz dy + zxdz$, 有

$$P = xy, Q = yz, R = zx$$

但 $\frac{\partial R}{\partial y} = 0 \neq y = \frac{\partial Q}{\partial z}$, 所以排除(C).

对于 $\int_{(0,0,0)}^{(1,1,1)} z^2 x dx + 2yz^2 dy + 3xy dz$, 有

$$P = z^2 x, Q = 2yz^2, R = 3xy$$

但 $\frac{\partial R}{\partial y} = 3x \neq 4yz = \frac{\partial Q}{\partial z}$, 所以排除(D).

21. 证明: 向量场 $\vec{F} = (x^2 - yz)\vec{i} + (y^2 - zx)\vec{j} + (z^2 - xy)\vec{k}$ 是有势场, 并求它的势函数.

解 (在曲面单连通区域内, $\vec{F} = P\vec{i} + Q\vec{j} + R\vec{k}$ 是有势场, 即存在 u 使 $\text{grad } u = \vec{F}$)

$$\Leftrightarrow du = Pdx + Qdy + Rdz \Leftrightarrow \frac{\partial R}{\partial y} = \frac{\partial Q}{\partial z}, \frac{\partial P}{\partial z} = \frac{\partial R}{\partial x}, \frac{\partial Q}{\partial x} = \frac{\partial P}{\partial y}$$

解 令

$$P = x^2 - yz, Q = y^2 - zx, R = z^2 - xy$$

则

$$\frac{\partial R}{\partial y} = -x = \frac{\partial Q}{\partial z}, \frac{\partial P}{\partial z} = -y = \frac{\partial R}{\partial x}, \frac{\partial Q}{\partial x} = -z = \frac{\partial P}{\partial y}$$

连续, 所以存在 $u(x, y, z)$ 使得

$$du = (x^2 - yz)dx + (y^2 - zx)dy + (z^2 - xy)dz$$

或

$$\text{grad } u = \vec{F} = (x^2 - yz)\vec{i} + (y^2 - zx)\vec{j} + (z^2 - xy)\vec{k}$$

所以 $\vec{F}$ 是有势场.

取起点为 $O(0,0,0)$, 终点为 $A(x, y, z)$, 则原函数为

$$u(x, y, z) = \int_{(0,0,0)}^{(x,y,z)} (x^2 - yz)dx + (y^2 - zx)dy + (z^2 - xy)dz + C$$

取积分路径为折线 $\overline{OB} + \overline{BD} + \overline{DA}$: 从点 $O(0,0,0)$ 沿直线 $\begin{cases} y=0 \\ z=0 \end{cases}$ (即 x 轴) 到点 $B(x,0,0)$,

再从点 $B(x,0,0)$ 沿直线 $\begin{cases} x=x \\ z=0 \end{cases}$ 到点 $D(x,y,0)$, 最后从点 $D(x,y,0)$ 沿直线 $\begin{cases} x=x \\ y=y \end{cases}$ 到点

$A(x, y, z)$, 所以

$$\overline{OB} : x = x, y = 0, z = 0, x \text{ 从 } 0 \text{ 到 } x$$

$$\overline{BD} : x = x (\text{固定}, dx = 0), y = y, z = 0, y \text{ 从 } 0 \text{ 到 } y$$

$$\overline{DA} : x = x (\text{固定}, dx = 0), y = y (\text{固定}, dy = 0), z = z, z \text{ 从 } 0 \text{ 到 } z$$

于是

$$\begin{aligned} u(x, y, z) &= \int_{\overline{OB} + \overline{BD} + \overline{DA}} (x^2 - yz)dx + (y^2 - zx)dy + (z^2 - xy)dz + C \\ &= \left(\int_{\overline{OB}} + \int_{\overline{BD}} + \int_{\overline{DA}} \right) (x^2 - yz)dx + (y^2 - zx)dy + (z^2 - xy)dz + C \\ &= \int_0^x x^2 dx + \int_0^y y^2 dy + \int_0^z (z^2 - xy)dz + C \\ &= \frac{x^3}{3} \Big|_{x=0}^{x=x} + \frac{y^3}{3} \Big|_{y=0}^{y=y} + \left(\frac{z^3}{3} - xyz \right) \Big|_{z=0}^{z=z} + C \\ &= \frac{x^3}{3} + \frac{y^3}{3} + \frac{z^3}{3} - xyz + C \end{aligned}$$

(或

$$\begin{aligned} du &= (x^2 - yz)dx + (y^2 - zx)dy + (z^2 - xy)dz \\ &= x^2 dx + y^2 dy + z^2 dz - (yz dx + zx dy + xy dz) \\ &= d\left(\frac{x^3}{3}\right) + d\left(\frac{y^3}{3}\right) + d\left(\frac{z^3}{3}\right) - d(xyz) \\ &= d\left(\frac{x^3}{3} + \frac{y^3}{3} + \frac{z^3}{3} - xyz + C\right) \end{aligned}$$

$$\text{所以 } u(x, y, z) = \frac{x^3}{3} + \frac{y^3}{3} + \frac{z^3}{3} - xyz + C$$

故所求势函数为

$$v(x, y, z) = -u(x, y, z) = -\frac{x^3}{3} - \frac{y^3}{3} - \frac{z^3}{3} + xyz + C$$

22. 在变力 $\vec{F} = yz\vec{i} + zx\vec{j} + xy\vec{k}$ 的作用下, 质点由原点沿任意曲线运动到椭球面

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1 \text{ 上第一卦限的点 } M(\xi, \eta, \varsigma), \text{ 问 } \xi, \eta, \varsigma \text{ 取何值时, 力 } \vec{F} \text{ 所做的功 } W \text{ 最}$$

大? 并求出 W 的最大值.

解 方法一、(利用曲线积分基本公式)

力 $\vec{F}$ 所做的功 W 为

$$\begin{aligned} W &= \int_{\widehat{OM}} \vec{F} \cdot d\vec{r} = \int_{\widehat{OM}} yzdx + zx dy + xydz \\ &= \int_{\widehat{OM}} d(xyz) = \int_{(0,0,0)}^{(\xi,\eta,\varsigma)} d(xyz) = xyz \Big|_{(0,0,0)}^{(\xi,\eta,\varsigma)} = \xi\eta\varsigma \end{aligned}$$

方法二、(在曲面单连通区域内, 曲线积分 $\int_{\widehat{AB}} Pdx + Qdy + Rdz$ 与路径无关

$$\Leftrightarrow \frac{\partial R}{\partial y} = \frac{\partial Q}{\partial z}, \frac{\partial P}{\partial z} = \frac{\partial R}{\partial x}, \frac{\partial Q}{\partial x} = \frac{\partial P}{\partial y})$$

力 $\vec{F}$ 所做的功 W 为

$$W = \int_{\widehat{OM}} \vec{F} \cdot d\vec{r} = \int_{\widehat{OM}} yzdx + zx dy + xydz$$

这里 $P = yz, Q = zx, R = xy$, 则

$$\frac{\partial R}{\partial y} = x = \frac{\partial Q}{\partial z}, \frac{\partial P}{\partial z} = y = \frac{\partial R}{\partial x}, \frac{\partial Q}{\partial x} = z = \frac{\partial P}{\partial y}$$

连续, 所以曲线积分与路径无关 $\widehat{OM}$ 取积分路径为直线段 $\overline{OM}$, 则

$$\overline{OM} : x = \xi t, y = \eta t, z = \varsigma t, t \text{ 从 } 0 \text{ 到 } 1$$

于是

$$\begin{aligned} W &= \int_{\widehat{OM}} yzdx + zx dy + xydz \\ &= \int_0^1 (\eta t \cdot \varsigma t \cdot \xi + \varsigma t \cdot \xi t \cdot \eta + \xi t \cdot \eta t \cdot \varsigma) dt \\ &= 3\xi\eta\varsigma \int_0^1 t^2 dt = \xi\eta\varsigma \end{aligned}$$

以下求 W 的最大值, 因为点 $M(\xi, \eta, \varsigma)$ 在椭球面 $\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1$ 上, 所以问题化

为求 $W = \xi\eta\varsigma$ 在条件 $\frac{\xi^2}{a^2} + \frac{\eta^2}{b^2} + \frac{\varsigma^2}{c^2} - 1 = 0$ 下极值问题, 设拉格朗日函数

$$F(\xi, \eta, \varsigma, \lambda) = \xi\eta\varsigma + \lambda \left(\frac{\xi^2}{a^2} + \frac{\eta^2}{b^2} + \frac{\varsigma^2}{c^2} - 1 \right)$$

令

$$\begin{cases} \frac{\partial F}{\partial \xi} = \eta \varsigma + \frac{2\lambda}{a^2} \xi = 0 \\ \frac{\partial F}{\partial \eta} = \xi \varsigma + \frac{2\lambda}{b^2} \eta = 0 \\ \frac{\partial F}{\partial \varsigma} = \xi \eta + \frac{2\lambda}{c^2} \varsigma = 0 \\ \frac{\partial F}{\partial \lambda} = \frac{\xi^2}{a^2} + \frac{\eta^2}{b^2} + \frac{\varsigma^2}{c^2} - 1 = 0 \end{cases}$$

解得

$$\xi = \frac{\sqrt{3}}{3} a, \eta = \frac{\sqrt{3}}{3} b, \varsigma = \frac{\sqrt{3}}{3} c$$

由问题的实际意义知, 所做功的最大值存在, 功的最大值为

$$W_{\max} = \frac{\sqrt{3}}{3} \cdot \frac{\sqrt{3}}{3} b \cdot \frac{\sqrt{3}}{3} c = \frac{\sqrt{3}}{9} abc$$

23. 求向量场 $\vec{F} = xyz(\vec{i} + \vec{j} + \vec{k})$ 在点 $M(1,2,3)$ 处的旋度以及在这点沿方向 $\vec{n} = \vec{i} + 2\vec{j} + 2\vec{k}$ 的环量面密度.

解 (向量场 $\vec{F} = P(x, y, z)\vec{i} + Q(x, y, z)\vec{j} + R(x, y, z)\vec{k}$ 在点 $M(x, y, z)$ 处的旋度为

$$\text{rot } \vec{F} = \begin{vmatrix} \vec{i} & \vec{j} & \vec{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ P & Q & R \end{vmatrix} = \left(\frac{\partial R}{\partial y} - \frac{\partial Q}{\partial z} \right) \vec{i} + \left(\frac{\partial P}{\partial z} - \frac{\partial R}{\partial x} \right) \vec{j} + \left(\frac{\partial Q}{\partial x} - \frac{\partial P}{\partial y} \right) \vec{k}$$

这里 $P = Q = R = xyz$, 所以旋度为

$$\begin{aligned} \text{rot } \vec{F}|_{(1,2,3)} &= \begin{vmatrix} \vec{i} & \vec{j} & \vec{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ xyz & xyz & xyz \end{vmatrix} \Big|_{(1,2,3)} \\ &= [x(z-y)\vec{i} + y(x-z)\vec{j} + z(y-x)\vec{k}]_{(1,2,3)} = \vec{i} - 4\vec{j} + 3\vec{k} \end{aligned}$$

(向量场 $\vec{F} = P(x, y, z)\vec{i} + Q(x, y, z)\vec{j} + R(x, y, z)\vec{k}$ 在点 $M(x, y, z)$ 处沿指定方向 $\vec{n}$ 的环量面密度为

$$\begin{aligned} \lim_{\Sigma \rightarrow M} \frac{\Gamma}{S} &= \lim_{\Sigma \rightarrow M} \frac{\oint_C \vec{F} \cdot d\vec{r}}{S} \\ &= \left(\frac{\partial R}{\partial y} - \frac{\partial Q}{\partial z} \right) \cos \alpha + \left(\frac{\partial P}{\partial z} - \frac{\partial R}{\partial x} \right) \cos \beta + \left(\frac{\partial Q}{\partial x} - \frac{\partial P}{\partial y} \right) \cos \gamma = \text{rot } \vec{F} \cdot \vec{n}^0 \end{aligned}$$

其中 $\vec{n}^0 = (\cos \alpha, \cos \beta, \cos \gamma)$ 为 $\vec{n}$ 的单位向量)

方向 $\vec{n} = \vec{i} + 2\vec{j} + 2\vec{k}$ 的单位向量为

$$\vec{n}^0 = \frac{\vec{n}}{|\vec{n}|} = \frac{\vec{i} + 2\vec{j} + 2\vec{k}}{\sqrt{1^2 + 2^2 + 2^2}} = \frac{1}{3}\vec{i} + \frac{2}{3}\vec{j} + \frac{2}{3}\vec{k}$$

所求环量面密度为

$$\text{rot} \vec{F} \cdot \vec{n}^0 = 1 \cdot \frac{1}{3} + (-4) \cdot \frac{2}{3} + 3 \cdot \frac{2}{3} = -\frac{1}{3}$$
