

习题课练习题解答

1. 设星形线在第一象限的部分为 C ，具有参数方程 $\begin{cases} x = a \cos^3 \theta \\ y = a \sin^3 \theta \end{cases} (a > 0, \theta \in [0, \frac{\pi}{2}])$,

计算

- (1) 曲线 C 与两坐标轴围成区域的面积；
- (2) 曲线 C 的弧长；
- (3) 曲线 C 与两坐标轴围成的图形绕 x 轴旋转一周所得旋转体的体积；
- (4) 曲线 C 绕 y 轴旋转一周所得旋转曲面的面积。

注：星形线的直角坐标方程为 $x^{\frac{2}{3}} + y^{\frac{2}{3}} = a^{\frac{2}{3}}$ ，其图形为

解 (1) 利用曲边梯形公式 $S = \int_a^b f(x)dx$ 得

$$S = \int_0^a y dx$$

将 $\begin{cases} x = a \cos^3 \theta \\ y = a \sin^3 \theta \end{cases}$ 代入，相当于做定积分换元 $x = a \cos^3 \theta$ ，当 $x = 0$ 时 $\theta = \frac{\pi}{2}$ (积分下

限)，当 $x = a$ 时 $\theta = 0$ (积分上限)，于是

$$\begin{aligned} S &= \int_0^a y dx = \int_{\frac{\pi}{2}}^0 a \sin^3 \theta d(a \cos^3 \theta) = \int_{\frac{\pi}{2}}^0 a \sin^3 \theta \cdot 3a \cos^2 \theta (-\sin \theta) d\theta \\ &= 3a^2 \int_0^{\frac{\pi}{2}} \sin^4 \theta \cos^2 \theta d\theta = 3a^2 \int_0^{\frac{\pi}{2}} \sin^4 \theta (1 - \sin^2 \theta) d\theta \\ &= 3a^2 \left[\int_0^{\frac{\pi}{2}} \sin^4 \theta d\theta - \int_0^{\frac{\pi}{2}} \sin^6 \theta d\theta \right] = 3a^2 \left[\frac{3}{4} \cdot \frac{1}{2} \cdot \frac{\pi}{2} - \frac{5}{6} \cdot \frac{3}{4} \cdot \frac{1}{2} \cdot \frac{\pi}{2} \right] = \frac{3\pi a^2}{32} \end{aligned}$$

(2) 参数曲线的弧长公式为 $s = \int_{\alpha}^{\beta} \sqrt{(\varphi'(t))^2 + (\psi'(t))^2} dt$ ，注意，与前面的定积分换元不同，公式中的积分下限一定要小于积分上限！

对于曲线 $\begin{cases} x = a \cos^3 \theta \\ y = a \sin^3 \theta \end{cases}, 0 \leq \theta \leq \frac{\pi}{2}$ ，有

$$\frac{dx}{d\theta} = 3a \cos^2 \theta (-\sin \theta), \frac{dy}{d\theta} = 3a \sin^2 \theta \cos \theta$$

所以所求弧长为

$$\begin{aligned} s &= \int_0^{\frac{\pi}{2}} \sqrt{\left(\frac{dx}{d\theta}\right)^2 + \left(\frac{dy}{d\theta}\right)^2} d\theta = \int_0^{\frac{\pi}{2}} \sqrt{[3a \cos^2 \theta (-\sin \theta)]^2 + (3a \sin^2 \theta \cos \theta)^2} d\theta \\ &= 3a \int_0^{\frac{\pi}{2}} |\sin \theta \cos \theta| d\theta = 3a \int_0^{\frac{\pi}{2}} \sin \theta \cos \theta d\theta = \frac{3a}{2} \sin^2 \theta \Big|_0^{\frac{\pi}{2}} = \frac{3a}{2} \end{aligned}$$

(在(1)中,

$$dx = 3a \cos^2 \theta (-\sin \theta) d\theta > 0 \Rightarrow d\theta < 0 \text{ 及 } dy = 3a \sin^2 \theta \cos \theta d\theta < 0, \text{ 但弧微}$$

分默认大于零, 所以由 $ds = \sqrt{\left(\frac{dx}{d\theta}\right)^2 + \left(\frac{dy}{d\theta}\right)^2} d\theta > 0 \Rightarrow d\theta > 0$, 从而弧长公式中的积分下限必须小于积分上限)

(3) 利用旋转体体积公式 $V = \pi \int_a^b [f(x)]^2 dx$ (绕 x 轴旋转) 得

$$V = \pi \int_0^a y^2 dx$$

将 $\begin{cases} x = a \cos^3 \theta \\ y = a \sin^3 \theta \end{cases}$ 代入, 相当于做定积分换元 $x = a \cos^3 \theta$, 当 $x = 0$ 时 $\theta = \frac{\pi}{2}$ (积分下

限), 当 $x = a$ 时 $\theta = 0$ (积分上限), 于是

$$\begin{aligned} V &= \pi \int_{\frac{\pi}{2}}^0 (a \sin^3 \theta)^2 d(a \cos^3 \theta) = \pi \int_{\frac{\pi}{2}}^0 (a \sin^3 \theta)^2 \cdot 3a \cos^2 \theta (-\sin \theta) d\theta \\ &= 3\pi a^3 \int_0^{\frac{\pi}{2}} \sin^7 \theta \cos^2 \theta d\theta = 3\pi a^3 \int_0^{\frac{\pi}{2}} \sin^7 \theta (1 - \sin^2 \theta) d\theta \\ &= 3\pi a^3 \left[\int_0^{\frac{\pi}{2}} \sin^7 \theta d\theta - \int_0^{\frac{\pi}{2}} \sin^9 \theta d\theta \right] = 3\pi a^3 \left[\frac{6}{7} \cdot \frac{4}{5} \cdot \frac{2}{3} - \frac{8}{9} \cdot \frac{6}{7} \cdot \frac{4}{5} \cdot \frac{2}{3} \right] = \frac{16\pi a^3}{105} \end{aligned}$$

(4) 利用旋转曲面面积公式 $S = 2\pi \int_c^d |g(y)| \sqrt{1 + (g'(y))^2} dy$ (绕 y 轴旋转) 得

$$S = 2\pi \int_0^a x \sqrt{1 + \left(\frac{dx}{dy}\right)^2} dy$$

将 $\begin{cases} x = a \cos^3 \theta \\ y = a \sin^3 \theta \end{cases}$ 代入, 相当于做定积分换元 $y = a \sin^3 \theta$, 当 $y = 0$ 时 $\theta = 0$ (积分下

$$\text{限}), \text{ 当 } y = a \text{ 时 } \theta = \frac{\pi}{2} \text{ (积分上限), 且 } \frac{dx}{dy} = \frac{\frac{dx}{d\theta}}{\frac{dy}{d\theta}} = \frac{3a \cos^2 \theta (-\sin \theta)}{3a \sin^2 \theta \cos \theta} = -\cot \theta,$$

于是

$$\begin{aligned}
S &= 2\pi \int_0^a x \sqrt{1 + \left(\frac{dx}{dy}\right)^2} dy = 2\pi \int_0^{\frac{\pi}{2}} a \cos^3 \theta \sqrt{1 + (-\cot \theta)^2} d(a \sin^3 \theta) \\
&= 2\pi \int_0^{\frac{\pi}{2}} a \cos^3 \theta \cdot |\csc \theta| \cdot 3a \sin^2 \theta \cos \theta d\theta = 6\pi a^2 \int_0^{\frac{\pi}{2}} \cos^4 \theta \sin \theta d\theta \\
&= -6\pi a^2 \int_0^{\frac{\pi}{2}} \cos^4 \theta d\cos \theta = -6\pi a^2 \left(\frac{1}{5} \cos^5 \theta \right) \Big|_0^{\frac{\pi}{2}} = \frac{6\pi a^2}{5}
\end{aligned}$$

或直接用微元法分析

绕 y 轴的面积微元为

$$dS = 2\pi |x| ds = 2\pi |x| \sqrt{\left(\frac{dx}{d\theta}\right)^2 + \left(\frac{dy}{d\theta}\right)^2} d\theta$$

(区间 $[y, y + dy]$ 对应的旋转曲面用剪刀裁开近似矩形, 矩形的长为圆周长 $2\pi|x|$, 宽为

弧长微分 ds (千万要注意不是 dy), 又注意到 $ds > 0$, 所以 $d\theta > 0$, 故下面的定积分

的积分下限一定要小于积分上限!)

故所求旋转曲面面积为

$$\begin{aligned}
S &= 2\pi \int_0^{\frac{\pi}{2}} |x| \sqrt{\left(\frac{dx}{d\theta}\right)^2 + \left(\frac{dy}{d\theta}\right)^2} d\theta \\
&= 2\pi \int_0^{\frac{\pi}{2}} |a \cos^3 \theta| \sqrt{[3a \cos^2 \theta (-\sin \theta)]^2 + (3a \sin^2 \theta)^2} d\theta \\
&\quad (\text{注意, 此处代入参数表达式是套公式, 不是定积分换元}) \\
&= 6\pi a^2 \int_0^{\frac{\pi}{2}} \cos^4 \theta \sin \theta d\theta = \frac{6\pi a^2}{5}
\end{aligned}$$

2. 设有双纽线 $C: (x^2 + y^2)^2 = a^2(x^2 - y^2) (a > 0)$,

(1) 求双纽线 C 围成区域的面积:

(2) 求双纽线 C 绕 x 轴旋转所得旋转曲面的面积.

注: 双纽线的图形

(13) 伯努利双纽线

$$(x^2 + y^2)^2 = 2a^2 xy;$$

$$\rho^2 = a^2 \sin 2\varphi.$$

(14) 伯努利双纽线

$$(x^2 + y^2)^2 = a^2(x^2 - y^2);$$

$$\rho^2 = a^2 \cos 2\varphi.$$

解 (1) 双纽线 $(x^2 + y^2)^2 = a^2(x^2 - y^2)$ 关于两坐标轴都是对称的 (将 x 换成 $-x$ 及将

y 换成 $-y$ 方程不变, 参见其图形), 利用公式 $\begin{cases} x = r \cos \theta \\ y = r \sin \theta \end{cases}$ 将其化为极坐标曲线

$$r^2 = a^2 \cos 2\theta$$

由对称性, 其围成的面积等于其第一象限围成区域面积 (对应 $0 \leq \theta \leq \frac{\pi}{4}$ 的部分, 范围由

$\cos 2\theta \geq 0$ 确定) 的四倍, 于是所求面积为

$$S = 4 \cdot \frac{1}{2} \int_0^{\frac{\pi}{4}} r^2 d\theta = 2 \int_0^{\frac{\pi}{4}} a^2 \cos 2\theta d\theta = a^2 \sin 2\theta \Big|_0^{\frac{\pi}{4}} = a^2$$

(2) 由对称性, 所求旋转曲面面积等于双纽线在第一象限部分绕 x 轴旋转所得旋转曲面面积的两倍.

用微元法分析, 在极坐标系下绕 x 轴的面积微元为

$$dS = 2\pi |y| ds = 2\pi |r \sin \theta| \sqrt{r^2 + \left(\frac{dr}{d\theta}\right)^2} d\theta$$

故所求面积为

$$S = 2 \cdot \int_0^{\frac{\pi}{4}} 2\pi |r \sin \theta| \sqrt{r^2 + \left(\frac{dr}{d\theta}\right)^2} d\theta$$

(由 $ds > 0$ 知 $d\theta > 0$, 所以积分下限一定要小于积分上限!)

由 $r^2 = a^2 \cos 2\theta$ 得

$$r = a\sqrt{\cos 2\theta}, \frac{dr}{d\theta} = -a \frac{\sin 2\theta}{\sqrt{\cos 2\theta}}$$

所以

$$\begin{aligned} S &= 2 \cdot \int_0^{\frac{\pi}{4}} 2\pi |a\sqrt{\cos 2\theta} \sin \theta| \sqrt{\left(a\sqrt{\cos 2\theta}\right)^2 + \left(-a \frac{\sin 2\theta}{\sqrt{\cos 2\theta}}\right)^2} d\theta \\ &= 4\pi a^2 \int_0^{\frac{\pi}{4}} \sin \theta d\theta = 4\pi a^2 (-\cos \theta) \Big|_0^{\frac{\pi}{4}} = 2\pi a^2 (2 - \sqrt{2}) \end{aligned}$$
