

【习题】

1. 设函数 $y=f(x)$ 二阶可导, 且 $f'(x) < 0, f''(x) < 0$, 记 $dy=f(x+\Delta x)-f(x)$, $dy=f'(x)\Delta x$, 则当 $\Delta x > 0$ 时, 有

(A) $\Delta y \geq dy > 0$ (B) $\Delta y < dy < 0$ (C) $dy > \Delta y > 0$ (D) $dy < \Delta y < 0$.

解: $dy=f'(x)\Delta x < 0$,

$$\Delta y = f(x+\Delta x) - f(x) = f'(x+\theta_1\Delta x)\Delta x < 0 \quad (0 < \theta_1 < 1)$$

$$\Delta y - dy = f'(x+\theta_1\Delta x)\Delta x - f'(x)\Delta x \quad (\text{即 } \theta_1 = x + \theta_1\Delta x \text{ 介于 } x \text{ 与 } x+\Delta x \text{ 之间})$$

$$= [f'(x+\theta_1\Delta x) - f'(x)]\Delta x$$

$$= [f''(x+\theta_2\Delta x)(x+\theta_1\Delta x - x)]\Delta x \quad (0 < \theta_2 < 1)$$

$$= f''(x+\theta_2\Delta x)\theta_1(\Delta x)^2 < 0$$

(即 $\theta_2 = x + \theta_2\Delta x$ 介于 x 与 $x+\Delta x$ 之间)

所以 $\Delta y < dy < 0$

从而选 (B)

注: 这里用到了有限增量公式

$$f(x+\Delta x) - f(x) = f'(x+\theta\Delta x)\Delta x \quad (0 < \theta < 1)$$

2. 设 $y=f(x)$, 其中 f 可导, 已知自变量 x 在点 $x=-1$ 处取增量 $\Delta x = -0.1$ 时, 函数的增量 Δy 的线性主部等于 0.1 , 则 $f'(-1) =$
 (A) $\frac{1}{4}$ (B) $\frac{1}{3}$ (C) $\frac{1}{2}$ (D) 1

解: $dy = y'dx = 2x f'(x^2) dx = 2x f'(x^2) \Delta x$

当 $x=-1, \Delta x = dx = -0.1$ 时, 函数增量 Δy 的线性主部, 即微分 $dy = 0.1$, 所以

$$0.1 = 2 \cdot (-1) f'((-1)^2) \cdot (-0.1)$$

$\Rightarrow f'(-1) = \frac{1}{2}$, 从而选 (C)

3. 已知函数 $y=y(x)$ 在任意点 x 处的增量 $\Delta y = \frac{y}{1+x^2}\Delta x + \alpha$, 且当 $\Delta x \rightarrow 0$ 时, α 是比 Δx 高阶的无穷小, $y(0) = \pi$, 则 $dy|_{x=1} =$
 (A) $2\pi dx$ (B) πdx (C) $\frac{1}{2}e^{\frac{\pi}{4}}dx$ (D) $\frac{\pi}{2}e^{\frac{\pi}{4}}dx$.

解: $y' = \lim_{\Delta x \rightarrow 0} \frac{\Delta y}{\Delta x} = \lim_{\Delta x \rightarrow 0} \frac{\frac{y}{1+x^2}\Delta x + \alpha}{\Delta x}$

$$= \lim_{\Delta x \rightarrow 0} \left[\frac{y}{1+x^2} + \frac{\alpha}{\Delta x} \right] = \frac{y}{1+x^2} + 0 = \frac{y}{1+x^2}$$

即

$$y' = \frac{y}{1+x^2}$$

$$\Rightarrow \frac{1}{y} y' = \frac{1}{1+x^2} \Rightarrow (\ln|y|)' = (\arctan x + C)'$$

$$\Rightarrow \ln|y| = \arctan x + C_1 = \ln e^{\arctan x + C_1}$$

$$\Rightarrow y = \pm e^{\arctan x + C_1} = \pm e^{C_1} e^{\arctan x}$$

记 $C = \pm e^{C_1}$, 又 $y = C e^{\arctan x}$, 由 $y(0) = \pi$ 得 $C = \pi$, $y = \pi e^{\arctan x}$

所以

$$y(1) = \pi e^{\frac{\pi}{4}}$$

故

$$dy|_{x=1} = y'(1) dx = \frac{y(1)}{1+1^2} dx = \frac{\pi}{2} e^{\frac{\pi}{4}} dx$$

从而求得 (D)

注: 以上解法拉格朗日中值定理推广: $f(x) = g'(x)$, $x \in I$
 $\Rightarrow f(x) = g(x) + C$, $x \in I$

4. 计算下列导数与微分.

(1) 设函数 $y = y(x)$ 由方程 $e^y + 6xy + x^2 - e = 0$ 所确定, 求

$$dy|_{x=0}, \frac{d^2y}{dx^2}|_{x=0}.$$

解: 方程两边关于 x 求导得

$$e^y \frac{dy}{dx} + 6y + 6x \frac{dy}{dx} + 2x = 0$$

解得 $\frac{dy}{dx} = -\frac{2x+6y}{e^y+6x}$

在方程中令 $x=0$ 得 $e^y - e = 0 \Rightarrow y=1$, 所以

$$\frac{dy}{dx}|_{x=0} = -\frac{2x+6y}{e^y+6x}|_{x=0, y=1} = -\frac{6}{e}$$

故 $dy|_{x=0} = \frac{dy}{dx}|_{x=0} dx = -\frac{6}{e} dx$

求二阶导得

$$\frac{d^2y}{dx^2} = \frac{d}{dx} \left(\frac{dy}{dx} \right) = \frac{d}{dx} \left(-\frac{2x+6y}{e^y+6x} \right)$$

$$= -\frac{(2+6\frac{dy}{dx})(e^y+6x) - (2x+6y)(e^y\frac{dy}{dx}+6)}{(e^y+6x)^2}$$

将 $x=0, y=1, \frac{dy}{dx}|_{x=0} = -\frac{6}{e}$ 代入上式得

$$\frac{d^2y}{dx^2}|_{x=0} = -\frac{(2+6(-\frac{6}{e}))(e+0) - (0+6\cdot 1)(e(-\frac{6}{e})+6)}{(e+0)^2}$$

$$= \frac{36}{e^2} - \frac{2}{e}$$

(2) 已知函数 $y=f(x)$ 由参数方程 $\begin{cases} x = \frac{t^2}{2} + t + 1 \\ e^y + y + t - 1 = 0 \end{cases}$ 所确定,
求 $\frac{dy}{dx} \Big|_{x=1}, \frac{dx}{dy} \Big|_{x=1}$.

解: 对第一式关于 t 求导得

$$\frac{dx}{dt} = t^2 + 1$$

第二式关于 t 求导得

$$e^y \frac{dy}{dt} + \frac{dy}{dt} + 1 = 0$$

解得

$$\frac{dy}{dt} = -\frac{1}{e^y + 1}$$

函数 $y=f(x)$ 的导数为

$$\frac{dy}{dx} = \frac{\frac{dy}{dt}}{\frac{dx}{dt}} = \frac{-\frac{1}{e^y + 1}}{t^2 + 1} = -\frac{1}{(e^y + 1)(t^2 + 1)}$$

在原参数方程中令 $x=1$ 得 $t=0, y=0$, (方程 $e^y + y - 1 = 0$ 有唯一根 $y=0$)

所以 $\frac{dy}{dx} \Big|_{x=1} = -\frac{1}{(e^y + 1)(t^2 + 1)} \Big|_{\substack{t=0 \\ y=0}} = -\frac{1}{2}$

故 $dx \Big|_{x=1} = \frac{dx}{dy} \Big|_{x=1} dy = -\frac{1}{2} dy$

(3) 设 $\begin{cases} x = t - \ln(1+t) \\ y = t^3 + t^2 \end{cases}$, 求 $\frac{d^2y}{dx^2} \Big|_{t=1}, \frac{d^2x}{dy^2} \Big|_{t=1}$.

解: 求参数方程所确定的函数 $y=y(x)$ 的导数.

$$\frac{dy}{dx} = \frac{\frac{dy}{dt}}{\frac{dx}{dt}} = \frac{(t^3 + t^2)'}{[t - \ln(1+t)]'} = \frac{3t^2 + 2t}{1 - \frac{1}{1+t}} = (3t+2)(1+t)$$

$$\frac{d^2y}{dx^2} = \frac{\frac{d}{dt}(\frac{dy}{dx})}{\frac{dx}{dt}} = \frac{[(3t+2)(1+t)]'}{[t - \ln(1+t)]'} = \frac{6t+5}{1 - \frac{1}{1+t}} = \frac{(6t+5)(1+t)}{t}$$

所以 $\frac{d^2y}{dx^2} \Big|_{t=1} = 22$

求参数方程所确定的函数 $x=x(y)$ 的导数

$$\frac{dx}{dy} = \frac{\frac{dx}{dt}}{\frac{dy}{dt}} = \frac{[t - \ln(1+t)]'}{(t^3 + t^2)'} = \frac{1 - \frac{1}{1+t}}{3t^2 + 2t} = \frac{1}{(3t+2)(1+t)}$$

$$\frac{d^2x}{dy^2} = \frac{\frac{d}{dt}(\frac{dx}{dy})}{\frac{dy}{dt}} = \frac{[\frac{1}{(3t+2)(1+t)}]'}{(t^3 + t^2)'} = -\frac{(3t+2)(1+t)}{3t^2 + 2t}$$

$$= -\frac{(3t+2)(1+t)}{(3t+2)^2(1+t)^2}$$

所以 $\frac{d^2x}{dy^2} \Big|_{t=1} = -\frac{1}{500}$

(4) 设 $x = f^{-1}(y)$ 是函数 $x = f(y) = \frac{y^3}{3} + y + 1$ 的反函数, 求 $d + \frac{d^2 f^{-1}(x)}{dx^2}$.

解: $y = f(x)$ 与 $x = f(y) = \frac{y^3}{3} + y + 1$ 互为反函数, 由反函数求导法可得

$$(f^{-1}(x))' = \frac{dy}{dx} = \frac{1}{\frac{dx}{dy}} = \frac{1}{f'(y)} = \frac{1}{y^2 + 1} = \frac{1}{[f^{-1}(x)]^2 + 1}$$

令 $y=0$ 得 $x = f(0) = 1$, 所以 $f^{-1}(1) = 0 = y$, 于是

$$df^{-1}(x)|_{x=1} = (f^{-1}(x))'|_{x=1} = \frac{1}{y^2 + 1}|_{y=0} dx = 1 \cdot dx = dx.$$

求二阶导数

$$\frac{d^2 f^{-1}(x)}{dx^2} = \frac{d}{dx} \left(\frac{df^{-1}(x)}{dx} \right) = \frac{d}{dx} \left(\frac{1}{y^2 + 1} \right)$$

$$= \frac{d}{dy} \left(\frac{1}{y^2 + 1} \right) \cdot \frac{dy}{dx}$$

$$\left(\frac{df^{-1}(x)}{dx} = (f^{-1}(x))' = \frac{dy}{dx} \right)$$

$$= - \frac{1}{(y^2 + 1)^2} \cdot 2y \cdot \frac{1}{y^2 + 1}$$

$$= - \frac{2y}{(y^2 + 1)^3} = - \frac{2f^{-1}(x)}{[(f^{-1}(x))^2 + 1]^3}$$

(5) 设 $y = \sin^4 x + \cos^4 x$, 求 $y^{(n)}$.

$$\text{解: } y = (\sin^2 x + \cos^2 x)^2 - 2\sin^2 x \cos^2 x$$

$$= 1 - \frac{1}{2} \sin^2 2x$$

$$\left(\text{利用 } \sin^2 x = \frac{1 - \cos 2x}{2} \right)$$

$$= 1 - \frac{1}{2} \cdot \frac{1 - \cos 4x}{2} = \frac{3}{4} + \frac{1}{4} \cos 4x$$

求 n 阶导数

$$y^{(n)} = \left(\frac{3}{4} \right)^{(n)} + \frac{1}{4} (\cos 4x)^{(n)}$$

$$= 0 + \frac{1}{4} \cdot 4^n \cos(4x + \frac{n\pi}{2}) = 4^{n-1} \cos(4x + \frac{n\pi}{2})$$

$$\text{其中 } (\cos 4x)^{(n)} = 4^n (\cos u)^{(n)}|_{u=4x}$$

$$= 4^n \cos(u + \frac{n\pi}{2})|_{u=4x} = 4^n \cos(4x + \frac{n\pi}{2})$$

(6) 设 $f(x) = \ln(7x - 10x^2)$, 求 $f^{(n)}(x)$,

$$\text{解: } f(x) = \ln x + \ln(7 - 10x)$$

求 n 阶导数

$$f^{(n)}(x) = (\ln x)^{(n)} + [\ln(7 - 10x)]^{(n)}$$

$$= \frac{(-1)^{n-1}(n-1)!}{x^n} + (-10)^n \frac{(-1)^{n-1}(n-1)!}{(7-10x)^n}$$

$$= \frac{(-1)^{n-1}(n-1)!}{x^n} + 10^n \frac{(n-1)!}{(7-10x)^n}$$

其中 $[\ln(7-10x)]^{(n)} = (-10)^n (\ln u)^{(n)} \Big|_{u=7-10x}$

$$= (-10)^n \frac{(-1)^{n-1}(n-1)!}{u^n} = (-10)^n \frac{(-1)^{n-1}(n-1)!}{(7-10x)^n}$$

(7) 设 $y = \frac{x}{2x^2-3x+1}$, 求 $\frac{d^n y}{dx^n}$

解: 设 $\frac{x}{2x^2-3x+1} = \frac{x}{(2x-1)(x-1)} = \frac{A}{2x-1} + \frac{B}{x-1}$

去分母得

$$x = A(x-1) + B(2x-1)$$

$$= (A+2B)x + (-A-B)$$

比较两边同次项系数得

$$\begin{cases} A+2B=1 \\ A+B=0 \end{cases} \Rightarrow A=-1, B=1$$

所以 $y = \frac{-1}{2x-1} + \frac{1}{x-1}$

求 $y^{(n)}$ 得

$$y^{(n)} = -\left(\frac{1}{2x-1}\right)^{(n)} + \left(\frac{1}{x-1}\right)^{(n)}$$

$$= -2^n \frac{(-1)^n n!}{(2x-1)^{n+1}} + \frac{(-1)^n n!}{(x-1)^{n+1}}$$

其中 $\left(\frac{1}{2x-1}\right)^{(n)} = 2^n \left(\frac{1}{u}\right)^{(n)} \Big|_{u=2x-1}$

$$= 2^n \frac{(-1)^n n!}{u^{n+1}} \Big|_{u=2x-1} = 2^n \frac{(-1)^n n!}{(2x-1)^{n+1}}$$

(8) 设 $y = x^2 e^{2x+1}$, 求 $y^{(20)}$

解: 由莱布尼兹公式得

$$y^{(20)} = [e^{2x+1} \cdot x^2]^{(20)}$$

$$= (e^{2x+1})^{(20)} \cdot x^2 + 20 \cdot (e^{2x+1})^{(19)} \cdot (x^2)' + \frac{20 \cdot 19}{2} (e^{2x+1})^{(18)} (x^2)''$$

$$= 2^{20} e^{2x+1} \cdot x^2 + 20 \cdot 2^{19} e^{2x+1} \cdot 2x + \frac{20 \cdot 19}{2} \cdot 2^{18} e^{2x+1} \cdot 2$$

令 $x=0$ 得 $y_{(0)}^{(20)} = \frac{20 \cdot 19}{2} \cdot 2^{18} \cdot e \cdot 2 = 95 \cdot 2^{20} e$

5. 计算下列极限

$$(1) \lim_{x \rightarrow 0} \frac{e^{x^2} - e^{2-2\cos x}}{(x - \arcsin x) \tan x}$$

$\frac{0}{0}$ 型

$$= \lim_{x \rightarrow 0} \frac{e^{2-2\cos x} (e^{x^2-2+2\cos x} - 1)}{(x - \arcsin x) \tan x}$$

$$= \lim_{x \rightarrow 0} \frac{e^{2-2\cos x} \cdot (x^2 - 2 + 2\cos x)}{(-\frac{1}{6}x^3) \cdot x}$$

$$= -6 \lim_{x \rightarrow 0} e^{2-2\cos x} \lim_{x \rightarrow 0} \frac{x^2 - 2 + 2\cos x}{x^4}$$

$$= -6 \cdot 1 \lim_{x \rightarrow 0} \frac{2x - 2\sin x}{4x^3} = -3 \lim_{x \rightarrow 0} \frac{x - \sin x}{x^3}$$

$$= -3 \lim_{x \rightarrow 0} \frac{1 - \cos x}{3x^2} = -3 \lim_{x \rightarrow 0} \frac{\frac{x^2}{2}}{3x^2} = -\frac{1}{2}$$

证:

$$\lim_{x \rightarrow 0} \frac{x - \arcsin x}{x^3} = \lim_{x \rightarrow 0} \frac{1 - \frac{1}{\sqrt{1-x^2}}}{3x^2}$$

$$= \lim_{x \rightarrow 0} \frac{\sqrt{1-x^2} - 1}{3x^2}$$

$$= \lim_{x \rightarrow 0} \frac{1}{\sqrt{1-x^2}} \lim_{x \rightarrow 0} \frac{-x}{3x^2} = -\frac{1}{6}$$

故 $x - \arcsin x \sim -\frac{1}{6}x^3$

$$(2) \lim_{x \rightarrow 0} \left(\frac{1}{x^2} - \cot^2 x \right) \quad \infty - \infty \text{ 型}$$

$$= \lim_{x \rightarrow 0} \left(\frac{1}{x^2} - \frac{\cos^2 x}{\sin^2 x} \right) = \lim_{x \rightarrow 0} \frac{\sin^2 x - x^2 \cos^2 x}{x^2 \sin^2 x}$$

$$= \lim_{x \rightarrow 0} \frac{(\sin x + x \cos x)(\sin x - x \cos x)}{x^4}$$

$$= \lim_{x \rightarrow 0} \frac{\sin x + x \cos x}{x} \lim_{x \rightarrow 0} \frac{\sin x - x \cos x}{x^3}$$

$$= \lim_{x \rightarrow 0} \left(\frac{\sin x}{x} + \cos x \right) \lim_{x \rightarrow 0} \frac{\cos x - \cos x + x \sin x}{3x^2}$$

$$= \frac{2}{3} \lim_{x \rightarrow 0} \frac{\sin x}{x} = \frac{2}{3} \cdot 1 = \frac{2}{3}$$

$$(3) \lim_{x \rightarrow +\infty} (x^{\frac{1}{x}} - 1)^{\frac{1}{e^{1/x}}}$$

~~解~~ ~~为~~

$$\lim_{x \rightarrow +\infty} x^{\frac{1}{x}} \xrightarrow{\infty \cdot \frac{1}{x}} \lim_{x \rightarrow +\infty} e^{\frac{\ln x}{x}} = e^{\lim_{x \rightarrow +\infty} \frac{\ln x}{x}}$$

$$= e^{\lim_{x \rightarrow +\infty} \frac{1}{x}} = e^0 = 1$$

所以 $\lim_{x \rightarrow +\infty} (x^{\frac{1}{x}} - 1)^{\frac{1}{e^{1/x}}} \xrightarrow{\frac{0}{1}} 0^0$

~~解~~

$$\lim_{x \rightarrow +\infty} (x^{\frac{1}{x}} - 1)^{\frac{1}{e^{1/x}}} = \lim_{x \rightarrow +\infty} e^{\frac{\ln(x^{\frac{1}{x}} - 1)}{e^{1/x}}} = e^{\lim_{x \rightarrow +\infty} \frac{\ln(x^{\frac{1}{x}} - 1)}{e^{1/x}}}$$

$$= e^{\lim_{x \rightarrow +\infty} \frac{\frac{1}{x^{\frac{1}{x}-1}} \cdot x^{\frac{1}{x}} \cdot \frac{1 - \ln x}{x^2}}{e^{1/x}}}$$

$$= e^{\lim_{x \rightarrow +\infty} x^{\frac{1}{x}} \lim_{x \rightarrow +\infty} \frac{1}{x^{\frac{1}{x}-1}} \cdot \frac{1 - \ln x}{x}}$$

$$= e^{1 \cdot \lim_{x \rightarrow +\infty} \frac{1 - \ln x}{x}} = e^{\lim_{x \rightarrow +\infty} \frac{1}{x} \cdot \frac{1 - \ln x}{x}}$$

$$= e^{\lim_{x \rightarrow +\infty} (\frac{1}{x} - 1)} = e^{-1}$$

记 $x^{\frac{1}{x}} - 1 = e^{\frac{\ln x}{x}} - 1 \sim \frac{\ln x}{x}$

$$(4) \lim_{n \rightarrow \infty} (n \tan n)^{n^2}$$

$$= \lim_{n \rightarrow \infty} \left[\left(1 + n \tan n - 1 \right)^{\frac{1}{n \tan n - 1}} \right]^{n^2 (n \tan n - 1)}$$

$$= e^{\lim_{n \rightarrow \infty} n^2 (n \tan n - 1)}$$

~~解~~

$$\lim_{x \rightarrow 0} \frac{\tan x - x}{x^3} = \lim_{x \rightarrow 0} \frac{\sec^2 x - 1}{3x^2} = \lim_{x \rightarrow 0} \frac{1 - \cos^2 x}{3x^2 \cos^2 x}$$

$$= \lim_{x \rightarrow 0} \frac{1 + \cos x}{\cos^2 x} \lim_{x \rightarrow 0} \frac{1 - \cos x}{3x^2} = 2 \lim_{x \rightarrow 0} \frac{\sin x}{6x}$$

$$= 2 \cdot \frac{1}{6} = \frac{1}{3}$$

所以 $\lim_{n \rightarrow \infty} n^2 (n \tan n - 1) = \lim_{n \rightarrow \infty} \frac{\tan n - \frac{1}{n}}{(\frac{1}{n})^3} = \frac{1}{3}$

故 $\lim_{n \rightarrow \infty} (n \tan n)^{n^2} = e^{\frac{1}{3}}$

6. 设 $\lim_{x \rightarrow 0} \frac{e^{\tan x} - a e^x}{bx - \sin 2x} = c \neq 0$, 求常数 a, b, c .

解: 由

$$0 \neq c = \lim_{x \rightarrow 0} \frac{e^{\tan x} - a e^x}{bx - \sin 2x}$$

知 $\lim_{x \rightarrow 0} (e^{\tan x} - a e^x) = 1 - a = 0 \Rightarrow a = 1$

从而

$$0 \neq c = \lim_{x \rightarrow 0} \frac{e^{\tan x} - e^x}{bx - \sin 2x}$$

$$= \lim_{x \rightarrow 0} \frac{e^x (e^{\tan x - x} - 1)}{bx - \sin 2x} = \lim_{x \rightarrow 0} \frac{e^x (\tan x - x)}{bx - \sin 2x}$$

$$= \lim_{x \rightarrow 0} e^x \lim_{x \rightarrow 0} \frac{\tan x - x}{bx - \sin 2x}$$

$$= 1 \cdot \lim_{x \rightarrow 0} \frac{\cos^3 x - 1}{b - 2\cos 2x}$$

由洛必达

$$\lim_{x \rightarrow 0} (b - 2\cos 2x) = b - 2 = 0 \Rightarrow b = 2$$

于是

$$c = \lim_{x \rightarrow 0} \frac{\frac{1}{\cos^2 x} - 1}{2 - 2\cos 2x} = \lim_{x \rightarrow 0} \frac{-\frac{1}{\cos^3 x} (-\sin x)}{4\sin 2x}$$

$$= \frac{1}{4} \lim_{x \rightarrow 0} \frac{1}{\cos^4 x} = \frac{1}{4} \cdot 1 = \frac{1}{4}$$

7. 设 $\lim_{x \rightarrow 0} \frac{\sin x + x \tan x}{x^3} = \frac{1}{2}$, 求 $\lim_{x \rightarrow 0} \frac{1 + \tan x}{x^2}$

解: $\lim_{x \rightarrow 0} \frac{\sin x + x \tan x}{x^3} = \lim_{x \rightarrow 0} \frac{\sin x - x + x + x \tan x}{x^3}$

$$= \lim_{x \rightarrow 0} \left(\frac{\sin x - x}{x^3} + \frac{1 + \tan x}{x^2} \right) = \frac{1}{2}$$

由 $\lim_{x \rightarrow 0} \frac{\sin x - x}{x^3} = \lim_{x \rightarrow 0} \frac{\cos x - 1}{3x^2} = \lim_{x \rightarrow 0} \frac{-\frac{x^2}{2}}{3x^2} = -\frac{1}{6}$

从而 $-\frac{1}{6} + \lim_{x \rightarrow 0} \frac{1 + \tan x}{x^2} = \frac{1}{2} \Rightarrow \lim_{x \rightarrow 0} \frac{1 + \tan x}{x^2} = \frac{2}{3}$

8. 设函数 $f(x)$ 在点 $x=0$ 的某邻域内有 n 阶连续导数, 且 $f(0) + f'(0) + \dots + f^{(n)}(0) \neq 0$, 证明: 存在唯一一组实数 $\lambda_1, \lambda_2, \lambda_3$ 使得 $\lambda_1 f(h) + \lambda_2 f(2h) + \lambda_3 f(3h) - f(0) = o(h^2)$

$$\text{证: } \lambda_1 f(h) + \lambda_2 f(2h) + \lambda_3 f(3h) - f(0) = o(h^2)$$

$$\Rightarrow 0 = \lim_{h \rightarrow 0} \frac{\lambda_1 f(h) + \lambda_2 f(2h) + \lambda_3 f(3h) - f(0)}{h^2}$$

$$= \lim_{h \rightarrow 0} \frac{\lambda_1 f'(h) + 2\lambda_2 f'(2h) + 3\lambda_3 f'(3h)}{2h}$$

$$= \lim_{h \rightarrow 0} \frac{\lambda_1 f''(h) + 4\lambda_2 f''(2h) + 9\lambda_3 f''(3h)}{2}$$

由此可知

$$\lim_{h \rightarrow 0} (\lambda_1 f(h) + \lambda_2 f(2h) + \lambda_3 f(3h) - f(0)) = (\lambda_1 + \lambda_2 + \lambda_3 - 1)f(0) = 0$$

$$\lim_{h \rightarrow 0} (\lambda_1 f'(h) + 2\lambda_2 f'(2h) + 3\lambda_3 f'(3h)) = (\lambda_1 + 2\lambda_2 + 3\lambda_3)f'(0) = 0$$

$$\lim_{h \rightarrow 0} (\lambda_1 f''(h) + 4\lambda_2 f''(2h) + 9\lambda_3 f''(3h)) = (\lambda_1 + 4\lambda_2 + 9\lambda_3)f''(0) = 0$$

而 $f(0) \neq 0, f'(0) \neq 0, f''(0) \neq 0$, 所以

$$\begin{cases} \lambda_1 + \lambda_2 + \lambda_3 - 1 = 0 \\ \lambda_1 + 2\lambda_2 + 3\lambda_3 = 0 \\ \lambda_1 + 4\lambda_2 + 9\lambda_3 = 0 \end{cases}$$

解得 $\lambda_1 = 3, \lambda_2 = -3, \lambda_3 = 1$, 为所求唯一一组实数.
