

练习题-定积分定义及含定积分的极限-解答

设 $f(x)$ 在 $[a, b]$ 上可积, 则

$$\int_a^b f(x)dx = \lim_{n \rightarrow \infty} \sum_{i=1}^n f(\xi_i) \Delta x_i \quad (\text{定积分定义})$$

用定积分定义求“无穷和或无穷积”数列的极限, 为此将区间 $[a, b]$ 作 n 等分, 这样, 分点

为 $x_i = a + \frac{i(b-a)}{n}, i = 0, 1, \dots, n$, 小区间长度为 $\Delta x_i = \frac{b-a}{n}$, 如果取 $\xi_i = x_i$ (为小

区间 $[x_{i-1}, x_i]$ 端点), 那么有公式

$$\int_a^b f(x)dx = \lim_{n \rightarrow \infty} \sum_{i=1}^n f\left(a + \frac{i(b-a)}{n}\right) \frac{b-a}{n} = \lim_{n \rightarrow \infty} \sum_{i=0}^{n-1} f\left(a + \frac{i(b-a)}{n}\right) \frac{b-a}{n}$$

特别地, 有

$$\int_0^1 f(x)dx = \lim_{n \rightarrow \infty} \sum_{i=1}^n f\left(\frac{i}{n}\right) \frac{1}{n} = \lim_{n \rightarrow \infty} \sum_{i=0}^{n-1} f\left(\frac{i}{n}\right) \frac{1}{n}$$

如果取 $\xi_i = \frac{x_{i-1} + x_i}{2} = a + \frac{(2i-1)(b-a)}{2n}$ (为小区间 $[x_{i-1}, x_i]$ 的中点), 那么有公式

$$\int_a^b f(x)dx = \lim_{n \rightarrow \infty} \sum_{i=1}^n f\left(a + \frac{(2i-1)(b-a)}{2n}\right) \frac{b-a}{n}$$

1. 计算下列极限

$$(1) \lim_{n \rightarrow \infty} \frac{1}{n} \left(\sqrt{1 + \cos \frac{\pi}{n}} + \sqrt{1 + \cos \frac{2\pi}{n}} + \dots + \sqrt{1 + \cos \frac{n\pi}{n}} \right);$$

解

$$\begin{aligned} & \lim_{n \rightarrow \infty} \frac{1}{n} \left(\sqrt{1 + \cos \frac{\pi}{n}} + \sqrt{1 + \cos \frac{2\pi}{n}} + \dots + \sqrt{1 + \cos \frac{n\pi}{n}} \right) \\ &= \frac{1}{\pi} \lim_{n \rightarrow \infty} \frac{\pi}{n} \sum_{i=1}^n \sqrt{1 + \cos \frac{i\pi}{n}} \quad (\text{取 } \xi_i = x_i = \frac{i\pi}{n}, \text{ 则 } \Delta x_i = \frac{\pi}{n} \Rightarrow [a, b] = [x_0, x_n] = [0, \pi]) \\ &= \frac{1}{\pi} \int_0^\pi \sqrt{1 + \cos x} dx \quad (\text{由 } f(x_i) = \sqrt{1 + \cos x_i} = \sqrt{1 + \cos \frac{i\pi}{n}} \Rightarrow f(x) = \sqrt{1 + \cos x}) \\ &= \frac{\sqrt{2}}{\pi} \int_0^\pi \left| \cos \frac{x}{2} \right| dx = \frac{2\sqrt{2}}{\pi} \int_0^\pi \cos \frac{x}{2} d\left(\frac{x}{2}\right) = \frac{2\sqrt{2}}{\pi} \sin \frac{x}{2} \Big|_0^\pi = \frac{2\sqrt{2}}{\pi} \end{aligned}$$

$$(2) \lim_{n \rightarrow \infty} \left(\frac{1}{n\sqrt{n+1}} + \frac{\sqrt{2}}{n\sqrt{n+\frac{1}{2}}} + \cdots + \frac{\sqrt{n}}{n\sqrt{n+\frac{1}{n}}} \right);$$

解 (此题需适当放大缩小后用定积分定义和两边夹挤准则)

因为

$$\sum_{i=1}^n \frac{\sqrt{i}}{n\sqrt{n+1}} < \frac{1}{n\sqrt{n+1}} + \frac{\sqrt{2}}{n\sqrt{n+\frac{1}{2}}} + \cdots + \frac{\sqrt{n}}{n\sqrt{n+\frac{1}{n}}} = \sum_{i=1}^n \frac{\sqrt{i}}{n\sqrt{n+\frac{1}{i}}} < \sum_{i=1}^n \frac{\sqrt{i}}{n\sqrt{n}}$$

其中

$$\lim_{n \rightarrow \infty} \sum_{i=1}^n \frac{\sqrt{i}}{n\sqrt{n}} = \lim_{n \rightarrow \infty} \sum_{i=1}^n \sqrt{\frac{i}{n}} \cdot \frac{1}{n} = \int_0^1 \sqrt{x} dx = \frac{2}{3}$$

$$\lim_{n \rightarrow \infty} \sum_{i=1}^n \frac{\sqrt{i}}{n\sqrt{n+1}} = \lim_{n \rightarrow \infty} \frac{\sqrt{n}}{\sqrt{n+1}} \sum_{i=1}^n \sqrt{\frac{i}{n}} \cdot \frac{1}{n} \lim_{n \rightarrow \infty} \frac{\sqrt{n}}{\sqrt{n+1}} \lim_{n \rightarrow \infty} \sum_{i=1}^n \sqrt{\frac{i}{n}} \cdot \frac{1}{n} = 1 \cdot \int_0^1 \sqrt{x} dx = \frac{2}{3}$$

由两边夹挤准则知

$$\lim_{n \rightarrow \infty} \left(\frac{1}{n\sqrt{n+1}} + \frac{\sqrt{2}}{n\sqrt{n+\frac{1}{2}}} + \cdots + \frac{\sqrt{n}}{n\sqrt{n+\frac{1}{n}}} \right) = \frac{2}{3}$$

$$(3) \lim_{n \rightarrow \infty} \sum_{i=1}^n \frac{i}{(n+\sqrt{i})^2} \ln \left(1 + \frac{i}{n} \right);$$

解 (此题无法直接用定积分定义, 需要用两边夹挤准则)

因为 $\frac{i}{(n+\sqrt{n})^2} < \frac{i}{(n+\sqrt{i})^2} < \frac{i}{n^2}$ (要把分母中的 i 去掉使各项同分母), 所以

$$\frac{1}{(n+\sqrt{n})^2} \sum_{i=1}^n i \ln \left(1 + \frac{i}{n} \right) < \sum_{i=1}^n \frac{i}{(n+\sqrt{i})^2} \ln \left(1 + \frac{i}{n} \right) < \frac{1}{n^2} \sum_{i=1}^n i \ln \left(1 + \frac{i}{n} \right)$$

其中

$$\begin{aligned} \lim_{n \rightarrow \infty} \frac{1}{n^2} \sum_{i=1}^n i \ln \left(1 + \frac{i}{n} \right) &= \\ &= \lim_{n \rightarrow \infty} \sum_{i=1}^n \frac{i}{n} \ln \left(1 + \frac{i}{n} \right) \cdot \frac{1}{n} \quad (\text{取 } \xi_i = x_i = \frac{i}{n}, \text{ 则 } \Delta x_i = \frac{1}{n} \Rightarrow [a, b] = [x_0, x_n] = [0, 1]) \end{aligned}$$

$$\begin{aligned}
&= \int_0^1 x \ln(1+x) dx \quad (\text{由 } f(x_i) = x_i \ln(1+x_i) = \frac{i}{n} \ln\left(1+\frac{i}{n}\right) \Rightarrow f(x) = x \ln(1+x)) \\
&= \int_0^1 \ln(1+x) d\left(\frac{x^2}{2}\right) = \frac{x^2}{2} \ln(1+x) \Big|_0^1 - \int_0^1 \frac{x^2}{2} \frac{1}{1+x} dx = \frac{1}{2} \ln 2 - \frac{1}{2} \int_0^1 \left(x-1+\frac{1}{1+x}\right) dx \\
&= \frac{1}{2} \ln 2 - \frac{1}{2} \left[\frac{x^2}{2} - x + \ln(1+x) \right]_0^1 = \frac{1}{2} \ln 2 - \frac{1}{2} \left(-\frac{1}{2} + \ln 2 \right) = \frac{1}{4}
\end{aligned}$$

及

$$\begin{aligned}
&\lim_{n \rightarrow \infty} \frac{1}{(n+\sqrt{n})^2} \sum_{i=1}^n i \ln\left(1+\frac{i}{n}\right) = \lim_{n \rightarrow \infty} \frac{n^2}{(n+\sqrt{n})^2} \frac{1}{n^2} \sum_{i=1}^n i \ln\left(1+\frac{i}{n}\right) \\
&= \lim_{n \rightarrow \infty} \frac{n^2}{(n+\sqrt{n})^2} \lim_{n \rightarrow \infty} \sum_{i=1}^n \frac{i}{n} \ln\left(1+\frac{i}{n}\right) \cdot \frac{1}{n} = 1 \cdot \int_0^1 x \ln(1+x) dx = \frac{1}{4}
\end{aligned}$$

由两边夹挤准则知

$$\lim_{n \rightarrow \infty} \sum_{i=1}^n \frac{i}{(n+\sqrt{i})^2} \ln\left(1+\frac{i}{n}\right) = \frac{1}{4}$$

$$(4) \lim_{n \rightarrow \infty} \frac{1}{n+\sqrt[3]{n}+100} \sum_{k=1}^n \arctan \frac{2k-n}{n};$$

解

$$\begin{aligned}
&\lim_{n \rightarrow \infty} \frac{1}{n+\sqrt[3]{n}+100} \sum_{k=1}^n \arctan \frac{2k-n}{n} = \lim_{n \rightarrow \infty} \frac{n}{n+\sqrt[3]{n}+100} \cdot \frac{1}{n} \sum_{k=1}^n \arctan \frac{2k-n}{n} \\
&= \frac{1}{2} \lim_{n \rightarrow \infty} \sum_{k=1}^n \arctan \frac{2k-n}{n} \cdot \frac{2}{n} \quad (\text{取 } \xi_k = x_k = \frac{2k-n}{n}, \text{ 则 } \Delta x_k = \frac{2}{n} \Rightarrow [a, b] = [x_0, x_n] = [-1, 1]) \\
&= \frac{1}{2} \int_{-1}^1 \arctan x dx = 0 \quad (\text{由 } f(x_k) = \arctan x_k = \arctan \frac{2k-n}{n} \Rightarrow f(x) = \arctan x)
\end{aligned}$$

或

$$\begin{aligned}
&\lim_{n \rightarrow \infty} \frac{1}{n+\sqrt[3]{n}+100} \sum_{k=1}^n \arctan \frac{2k-n}{n} = \lim_{n \rightarrow \infty} \frac{n}{n+\sqrt[3]{n}+100} \cdot \frac{1}{n} \sum_{k=1}^n \arctan \frac{2k-n}{n} \\
&= \lim_{n \rightarrow \infty} \sum_{k=1}^n \arctan \left(2 \cdot \frac{k}{n} - 1 \right) \cdot \frac{1}{n} \quad (\text{取 } \xi_k = x_k = \frac{k}{n}, \text{ 则 } \Delta x_k = \frac{1}{n} \Rightarrow [a, b] = [x_0, x_n] = [0, 1]) \\
&= \int_0^1 \arctan(2x-1) dx = 0 \\
&(\text{由 } f(x_k) = \arctan(2x_k-1) = \arctan\left(2 \cdot \frac{k}{n} - 1\right) \Rightarrow f(x) = \arctan(2x-1))
\end{aligned}$$

$$(5) \lim_{n \rightarrow \infty} \frac{1}{n^2} \sum_{k=1}^n (2k-1) \sin \frac{2k-1}{2n};$$

解

$$\lim_{n \rightarrow \infty} \frac{1}{n^2} \sum_{k=1}^n (2k-1) \sin \frac{2k-1}{2n} = 2 \lim_{n \rightarrow \infty} \sum_{k=1}^n \frac{2k-1}{2n} \sin \frac{2k-1}{2n} \cdot \frac{1}{n}$$

(注意到 $\xi_k = \frac{2k-1}{2n}$ 不是小区间 $[x_{k-1}, x_k]$ 的端点, 这里 $x_k = \frac{k}{n}$, 则 $\Delta x_k = \frac{1}{n}$,

ξ_k 实际上是小区间 $[x_{k-1}, x_k]$ 的中点, 由 $x_k = \frac{k}{n} \Rightarrow [a, b] = [x_0, x_n] = [0, 1]$)

$$= 2 \int_0^1 x \sin x dx \quad (\text{由 } f(\xi_k) = \xi_k \sin \xi_k = \frac{2k-1}{2n} \sin \frac{2k-1}{2n} \Rightarrow f(x) = x \sin x)$$

$$= -2 \int_0^1 x d \cos x = -2x \cos x \Big|_0^1 + 2 \int_0^1 \cos x dx = -2 \cos 1 + 2 \sin 1$$

$$(6) \lim_{n \rightarrow \infty} \left(\frac{n^2+1}{n^3+1} + \frac{n^2+2}{n^3+2^3} + \cdots + \frac{n^2+n}{n^3+n^3} \right);$$

解

$$\lim_{n \rightarrow \infty} \left(\frac{n^2+1}{n^3+1} + \frac{n^2+2}{n^3+2^3} + \cdots + \frac{n^2+n}{n^3+n^3} \right) = \lim_{n \rightarrow \infty} \sum_{k=1}^n \frac{n^2+k}{n^3+k^3} = \lim_{n \rightarrow \infty} \sum_{k=1}^n \frac{n^2}{n^3+k^3} + \lim_{n \rightarrow \infty} \sum_{k=1}^n \frac{k}{n^3+k^3}$$

对于 $\lim_{n \rightarrow \infty} \sum_{k=1}^n \frac{n^2}{n^3+k^3}$, 用定积分定义计算, 有

$$\lim_{n \rightarrow \infty} \sum_{k=1}^n \frac{n^2}{n^3+k^3} = \lim_{n \rightarrow \infty} \sum_{k=1}^n \frac{1}{1 + \left(\frac{k}{n}\right)^3} \cdot \frac{1}{n} = \int_0^1 \frac{1}{1+x^3} dx = \int_0^1 \left(\frac{\frac{1}{3}}{x+1} + \frac{-\frac{1}{3}x + \frac{2}{3}}{x^2-x+1} \right) dx$$

$$= \left[\frac{1}{3} \ln(x+1) - \frac{1}{6} \ln(x^2-x+1) + \frac{1}{\sqrt{3}} \arctan \frac{x - \frac{1}{2}}{\frac{\sqrt{3}}{2}} \right] \Big|_0^1 = \frac{1}{3} \ln 2 + \frac{\pi}{3\sqrt{3}}$$

对于 $\lim_{n \rightarrow \infty} \sum_{k=1}^n \frac{k}{n^3+k^3}$, 用两边夹挤准则, 由于

$$\sum_{k=1}^n \frac{k}{n^3+n^3} < \sum_{k=1}^n \frac{k}{n^3+k^3} < \sum_{k=1}^n \frac{k}{n^3}$$

而

$$\lim_{n \rightarrow \infty} \sum_{k=1}^n \frac{k}{n^3} = \lim_{n \rightarrow \infty} \frac{1+2+\cdots+n}{n^3} = \lim_{n \rightarrow \infty} \frac{\frac{n(n+1)}{2}}{n^3} = 0$$

$$\lim_{n \rightarrow \infty} \sum_{k=1}^n \frac{k}{n^3 + n^3} = \lim_{n \rightarrow \infty} \frac{1+2+\cdots+n}{2n^3} = \lim_{n \rightarrow \infty} \frac{\frac{n(n+1)}{2}}{2n^3} = 0$$

由两边夹挤准则知

$$\lim_{n \rightarrow \infty} \sum_{k=1}^n \frac{k}{n^3 + k^3} = 0$$

或

$$\lim_{n \rightarrow \infty} \sum_{k=1}^n \frac{k}{n^3 + k^3} = \lim_{n \rightarrow \infty} \frac{1}{n} \sum_{k=1}^n \frac{\frac{k}{n}}{1 + \left(\frac{k}{n}\right)^3} \cdot \frac{1}{n} = \lim_{n \rightarrow \infty} \frac{1}{n} \lim_{n \rightarrow \infty} \sum_{k=1}^n \frac{\frac{k}{n}}{1 + \left(\frac{k}{n}\right)^3} \cdot \frac{1}{n} = 0 \cdot \int_0^1 \frac{1}{1+x^3} dx = 0$$

因此

$$\lim_{n \rightarrow \infty} \left(\frac{n^2+1}{n^3+1} + \frac{n^2+2}{n^3+2^3} + \cdots + \frac{n^2+n}{n^3+n^3} \right) = \frac{1}{3} \ln 2 + \frac{\pi}{3\sqrt{3}} + 0 = \frac{1}{3} \ln 2 + \frac{\pi}{3\sqrt{3}}$$

$$(7) \lim_{n \rightarrow \infty} \frac{\sqrt[n]{(n+1)(n+2)\cdots(n+n)}}{n}.$$

$$\text{解 } \lim_{n \rightarrow \infty} \frac{\sqrt[n]{(n+1)(n+2)\cdots(n+n)}}{n} = \lim_{n \rightarrow \infty} \sqrt[n]{\left(1+\frac{1}{n}\right)\left(1+\frac{2}{n}\right)\cdots\left(1+\frac{n}{n}\right)}$$

(为“无穷积”数列, 通过取对数转化为“无穷和”数列, 再用定积分定义)

$$\begin{aligned} &= \lim_{n \rightarrow \infty} e^{\ln \sqrt[n]{\left(1+\frac{1}{n}\right)\left(1+\frac{2}{n}\right)\cdots\left(1+\frac{n}{n}\right)}} = e^{\lim_{n \rightarrow \infty} \frac{1}{n} \left[\ln\left(1+\frac{1}{n}\right) + \ln\left(1+\frac{2}{n}\right) + \cdots + \ln\left(1+\frac{n}{n}\right) \right]} \\ &= e^{\int_0^1 \ln(1+x) dx} = e^{2\ln 2 - 1} = e^{\ln \frac{4}{e}} = \frac{4}{e} \end{aligned}$$

2. 设螺旋 $r = \theta, 0 \leq \theta \leq 2\pi$ 与极轴所围区域的面积为 A , 则 $A = ()$

$$(A) \lim_{n \rightarrow \infty} \sum_{i=1}^n \frac{4\pi^3 i^2}{n^3}; \quad (B) \lim_{n \rightarrow \infty} \sum_{i=1}^n \frac{4\pi^3 i^2}{n^2}; \quad (C) \lim_{n \rightarrow \infty} \sum_{i=1}^n \frac{8\pi^3 i^2}{n^3}; \quad (D) \lim_{n \rightarrow \infty} \sum_{i=1}^n \frac{2\pi^3 i^2}{n^3}.$$

解 将积分区间 $[0, 2\pi]$ 做 n 等分, 则分点为 $\theta_i = \frac{2\pi i}{n}, i = 0, 1, \cdots, n, \Delta\theta_i = \frac{2\pi}{n}$, 这样

所围区域被分割成 n 个小曲边扇形, 取 $\xi_i = \theta_i$, 则每个小曲边扇形的面积近似为以

$r_i = \xi_i = \theta_i = \frac{2\pi}{n}$ 为半径、以 $\Delta\theta_i = \frac{2\pi}{n}$ 为圆心角的小圆扇形面积

$$\frac{1}{2}\xi_i^2\Delta\theta_i = \frac{1}{2}\theta_i^2\Delta\theta_i = \frac{1}{2}\left(\frac{2\pi}{n}\right)^2 \frac{2\pi}{n}$$

由定积分定义得

$$A = \frac{1}{2} \int_0^{2\pi} \theta^2 d\theta = \lim_{n \rightarrow \infty} \sum_{i=1}^n \frac{1}{2} \theta_i^2 \Delta\theta_i = \lim_{n \rightarrow \infty} \sum_{i=1}^n \frac{1}{2} \left(\frac{2\pi}{n}\right)^2 \frac{2\pi}{n} = \lim_{n \rightarrow \infty} \sum_{i=1}^n \frac{4\pi^3 i^2}{n^3}$$

故选(A).

以下是含定积分的极限计算，通常要去积分号，方法主要有四种：（1）积出来；（2）求导；（3）定积分中值公式；（4）两边夹挤准则。

3. 计算极限 $\lim_{x \rightarrow +\infty} \sqrt[3]{x} \left[\ln \left(1 + \frac{\ln 2}{\sqrt[3]{x}} \right) + \int_x^{x+1} \frac{\sin t}{\sqrt{t + \cos t}} dt \right]$.

解

$$\begin{aligned} \lim_{x \rightarrow +\infty} \sqrt[3]{x} \left[\ln \left(1 + \frac{\ln 2}{\sqrt[3]{x}} \right) + \int_x^{x+1} \frac{\sin t}{\sqrt{t + \cos t}} dt \right] &= \lim_{x \rightarrow +\infty} \sqrt[3]{x} \ln \left(1 + \frac{\ln 2}{\sqrt[3]{x}} \right) + \lim_{x \rightarrow +\infty} \sqrt[3]{x} \int_x^{x+1} \frac{\sin t}{\sqrt{t + \cos t}} dt \\ &= \lim_{x \rightarrow +\infty} \sqrt[3]{x} \cdot \frac{\ln 2}{\sqrt[3]{x}} + \lim_{x \rightarrow +\infty} \sqrt[3]{x} \int_x^{x+1} \frac{\sin t}{\sqrt{t + \cos t}} dt = \ln 2 + \lim_{x \rightarrow +\infty} \sqrt[3]{x} \int_x^{x+1} \frac{\sin t}{\sqrt{t + \cos t}} dt \end{aligned}$$

由定积分中值定理知

$$\int_x^{x+1} \frac{\sin t}{\sqrt{t + \cos t}} dt = \frac{\sin \xi}{\sqrt{\xi + \cos \xi}}$$

其中 $x < \xi < x+1$ ，所以

$$\begin{aligned} \lim_{x \rightarrow +\infty} \sqrt[3]{x} \left[\ln \left(1 + \frac{\ln 2}{\sqrt[3]{x}} \right) + \int_x^{x+1} \frac{\sin t}{\sqrt{t + \cos t}} dt \right] &= \ln 2 + \lim_{x \rightarrow +\infty} \sqrt[3]{x} \cdot \frac{\sin \xi}{\sqrt{\xi + \cos \xi}} \\ &= \ln 2 + \lim_{x \rightarrow +\infty} \sqrt[3]{\frac{x}{\xi}} \cdot \frac{1}{\sqrt{1 + \frac{\cos \xi}{\xi}}} \cdot \frac{\sin \xi}{\sqrt[6]{\xi}} \end{aligned}$$

因为 $x < \xi < x+1$ ，所以当 $x \rightarrow +\infty$ 时 $\xi \rightarrow +\infty$ ，且

$$\lim_{x \rightarrow +\infty} \frac{x}{\xi} = 1, \lim_{x \rightarrow +\infty} \frac{\cos \xi}{\xi} = 0, \lim_{x \rightarrow +\infty} \frac{\sin \xi}{\sqrt[6]{\xi}} = 0$$

故

$$\lim_{x \rightarrow +\infty} \sqrt[3]{x} \left[\ln \left(1 + \frac{\ln 2}{\sqrt[3]{x}} \right) + \int_x^{x+1} \frac{\sin t}{\sqrt{t + \cos t}} dt \right] = \ln 2 + 1 \cdot 1 \cdot 0 = \ln 2$$

4. 计算极限 $\lim_{x \rightarrow 0} \int_{\ln(1+x)}^x \frac{(1-2t)^{\frac{1}{t}}}{t^2} dt$.

解 由定积分中值定理知

$$\int_{\ln(1+x)}^x \frac{(1-2t)^{\frac{1}{t}}}{t^2} dt = \frac{(1-2\xi)^{\frac{1}{\xi}}}{\xi^2} [x - \ln(1+x)]$$

其中 $\ln(1+x) < \xi < x$, 注意到 $x \rightarrow 0$ 时 $\xi \rightarrow 0$, 所以

$$\lim_{x \rightarrow 0} \int_{\ln(1+x)}^x \frac{(1-2t)^{\frac{1}{t}}}{t^2} dt = \lim_{x \rightarrow 0} (1-2\xi)^{\frac{1}{\xi}} \lim_{x \rightarrow 0} \frac{x - \ln(1+x)}{\xi^2}$$

其中

$$\lim_{x \rightarrow 0} (1-2\xi)^{\frac{1}{\xi}} = \lim_{x \rightarrow 0} \left[(1-2\xi)^{-\frac{1}{2\xi}} \right]^{-2} = \mathbf{e}^{-2}$$

对于 $\lim_{x \rightarrow 0} \frac{x - \ln(1+x)}{\xi^2}$, 因为

$$\frac{\ln(1+x)}{x} < \frac{\xi}{x} < 1 \quad (x > 0) \text{ 或 } 1 < \frac{\xi}{x} < \frac{\ln(1+x)}{x} \quad (x < 0)$$

而 $\lim_{x \rightarrow 0} 1 = 1$, $\lim_{x \rightarrow 0} \frac{\ln(1+x)}{x} = 1$, 由两边夹挤准则知

$$\lim_{x \rightarrow 0} \frac{\xi}{x} = 1$$

所以

$$\begin{aligned} \lim_{x \rightarrow 0} \frac{x - \ln(1+x)}{\xi^2} &= \lim_{x \rightarrow 0} \frac{x - \ln(1+x)}{x^2} \cdot \frac{x^2}{\xi^2} \\ &= \lim_{x \rightarrow 0} \frac{x - \ln(1+x)}{x^2} \lim_{x \rightarrow 0} \frac{x^2}{\xi^2} = \lim_{x \rightarrow 0} \frac{1 - \frac{1}{1+x}}{2x} \cdot 1 = \lim_{x \rightarrow 0} \frac{1}{2} \frac{1+x}{2} = \frac{1}{2} \end{aligned}$$

因此

$$\lim_{x \rightarrow 0} \int_{\ln(1+x)}^x \frac{(1-2t)^{\frac{1}{t}}}{t^2} dt = \lim_{x \rightarrow 0} \frac{x - \ln(1+x)}{\xi^2} \lim_{x \rightarrow 0} (1-2\xi)^{\frac{1}{\xi}} = \frac{1}{2} \mathbf{e}^{-2}$$

5. 设 $S(x) = \int_0^x |\cos t| dt$, (1) 当 n 为正整数, 且 $n\pi \leq x \leq (n+1)\pi$ 时, 证明:

$$2n \leq S(x) \leq 2(n+1); (2) \text{ 求 } \lim_{x \rightarrow +\infty} \frac{S(x)}{x}.$$

证 (1) 当 $n\pi \leq x \leq (n+1)\pi$ 时, 有

$$\int_0^{n\pi} |\cos t| dt \leq S(x) = \int_0^x |\cos t| dt \leq \int_0^{(n+1)\pi} |\cos t| dt$$

(被积函数 $|\cos t|$ 非负, 积分下限相同, 所以积分区间长则积分大)

由于 $|\cos t|$ 是周期为 π 的函数, 利用公式 $\int_a^{a+nT} f(x) dx = n \int_0^T f(x) dx$ 得

$$\int_0^{n\pi} |\cos t| dt = n \int_0^\pi |\cos t| dt = n \int_{\frac{\pi}{2}}^{\frac{3\pi}{2}} |\cos t| dt = 2n \int_0^{\frac{\pi}{2}} \cos t dt = 2n$$

$$\int_0^{(n+1)\pi} |\cos t| dt = (n+1) \int_0^\pi |\cos t| dt = 2(n+1)$$

所以

$$2n \leq S(x) \leq 2(n+1)$$

(2) (注意, 此极限不能洛必达法则, 事实上

$$\lim_{x \rightarrow +\infty} \frac{S(x)}{x} = \lim_{x \rightarrow +\infty} \frac{\int_0^x |\cos t| dt}{x} = \lim_{x \rightarrow +\infty} \frac{\left(\int_0^x |\cos t| dt \right)'}{(x)'} = \lim_{x \rightarrow +\infty} \frac{|\cos x|}{1} \text{ 不存在, 此题需用两}$$

边夹挤准则)

由于

$$\frac{2n}{(n+1)\pi} \leq \frac{S(x)}{x} \leq \frac{2(n+1)}{n\pi}$$

其中 $\lim_{n \rightarrow \infty} \frac{2(n+1)}{n\pi} = \frac{2}{\pi}$, $\lim_{n \rightarrow \infty} \frac{2n}{(n+1)\pi} = \frac{2}{\pi}$, 注意到 $x \rightarrow +\infty \Leftrightarrow n \rightarrow \infty$, 由两边夹

挤准则知

$$\lim_{x \rightarrow +\infty} \frac{S(x)}{x} = \lim_{x \rightarrow +\infty} \frac{\int_0^x |\cos t| dt}{x} = \frac{2}{\pi}$$

6. (1) 证明: 当 $0 \leq t \leq 1$ 时, $2t \leq 1 + \sin \frac{\pi t}{2} \leq 2$; (2) 求 $\lim_{n \rightarrow \infty} \left[\int_0^1 \left(1 + \sin \frac{\pi t}{2} \right)^n dt \right]^{\frac{1}{n}}$.

证 (1) 显然 $1 + \sin \frac{\pi t}{2} \leq 2$, 设 $f(t) = 1 + \sin \frac{\pi t}{2} - 2t$, 则

$$f'(t) = \frac{\pi}{2} \cos \frac{\pi t}{2} - 2 < 0, 0 \leq t \leq 1$$

所以 $f(t)$ 在区间 $0 \leq t \leq 1$ 上单调减少, 故当 $0 \leq t \leq 1$ 时, 有

$$f(t) \geq f(1) = 0 \Rightarrow 2t \leq 1 + \sin \frac{\pi t}{2}$$

因此, 当 $0 \leq t \leq 1$ 时, $2t \leq 1 + \sin \frac{\pi t}{2} \leq 2$.

(2) (极限式中的积分无法算出, 需用两边夹挤准则)

由 (1) 及定积分性质得

$$\frac{2^n}{n+1} = \int_0^1 (2t)^n dt \leq \int_0^1 \left(1 + \sin \frac{\pi t}{2}\right)^n dt \leq \int_0^1 2^n dt = 2^n$$

所以

$$\frac{2}{(n+1)^{\frac{1}{n}}} \leq \left[\int_0^1 \left(1 + \sin \frac{\pi t}{2}\right)^n dt \right]^{\frac{1}{n}} \leq 2$$

其中 $\lim_{n \rightarrow \infty} 2 = 2, \lim_{n \rightarrow \infty} \frac{2}{(n+1)^{\frac{1}{n}}} = 2$ (利用公式 $\lim_{n \rightarrow \infty} \sqrt[n]{n} = 1$), 由两边夹挤准则知

$$\lim_{n \rightarrow \infty} \left[\int_0^1 \left(1 + \sin \frac{\pi t}{2}\right)^n dt \right]^{\frac{1}{n}} = 2$$

7. (1) 证明: 当 $0 \leq x \leq 1$ 时, $0 \leq \ln(1+x) \leq x$; (2) 求 $\lim_{n \rightarrow \infty} \int_0^1 |\ln x| [\ln(1+x)]^n dx$.

证 (1) 由拉格朗日中值定理, 存在 $\xi \in (0,1)$, 使得

$$0 \leq \ln(1+x) = \ln(1+x) - \ln 1 = \frac{1}{1+\xi} \cdot x \leq x$$

得证.

(2) (极限式中的积分无法算出, 需用两边夹挤准则)

由 (1) 知当 $0 < x \leq 1$ 时, 有

$$0 \leq |\ln x| [\ln(1+x)]^n \leq x^n |\ln x|$$

由定积分性质得

$$0 \leq \int_0^1 |\ln x| [\ln(1+x)]^n dx \leq \int_0^1 x^n |\ln x| dx$$

其中

$$\begin{aligned}
\int_0^1 x^n |\ln x| dx &= -\int_0^1 x^n \ln x dx \\
&\quad \left(\text{注意, 在 } x=0 \text{ 处被积函数无定义, 但 } \lim_{n \rightarrow 0^+} x^n \ln x = 0, \text{ 所以它是定积分不是反常积分} \right) \\
&= -\frac{1}{n+1} \int_0^1 \ln x d(x^{n+1}) = -\frac{1}{n+1} \left[x^{n+1} \ln x \Big|_0^1 - \int_0^1 x^{n+1} \cdot \frac{1}{x} dx \right] \\
&= -\frac{1}{n+1} \left[0 - \lim_{x \rightarrow 0^+} x^{n+1} \ln x - \int_0^1 x^n dx \right] = -\frac{1}{n+1} \left[-\lim_{x \rightarrow 0^+} \frac{\ln x}{x^{-n-1}} - \frac{x^{n+1}}{n+1} \Big|_0^1 \right] \\
&= -\frac{1}{n+1} \left[-\lim_{x \rightarrow 0^+} \frac{\frac{1}{x}}{(-n-1)x^{-n-2}} - \frac{x^{n+1}}{n+1} \Big|_0^1 \right] = -\frac{1}{n+1} \left[\lim_{x \rightarrow 0^+} \frac{x^{n+1}}{n+1} - \frac{1}{n+1} \right] \\
&= -\frac{1}{n+1} \left[0 - \frac{1}{n+1} \right] = \frac{1}{(n+1)^2}
\end{aligned}$$

而 $\lim_{n \rightarrow \infty} 0 = 0$, $\lim_{n \rightarrow \infty} \int_0^1 x^n |\ln x| dx = \lim_{n \rightarrow \infty} \frac{1}{(n+1)^2} = 0$, 由两边夹挤准则知

$$\lim_{n \rightarrow \infty} \int_0^1 |\ln x| [\ln(1+x)]^n dx = 0$$

(注意, 此题无法用定积分中值公式, 事实上, 有

$$\lim_{n \rightarrow \infty} \int_0^1 |\ln x| [\ln(1+x)]^n dx = \lim_{n \rightarrow \infty} |\ln \xi_n| [\ln(1+\xi_n)]^n \quad (0 < \xi_n \leq 1)$$

尽管 $0 \leq [\ln(1+\xi_n)]^n \leq (\ln 2)^n \rightarrow 0$, 但 $|\ln \xi_n|$ 可能趋于无穷, 无法给出极限)

8. 证明 $\lim_{n \rightarrow \infty} \int_0^{\frac{\pi}{2}} \sin^n x dx = 0$ (n 为正整数).

证 (此题用常规的去积分号方法, 例如, 积出来, 定积分中值定理, 求导, 两边夹挤定理等, 都证明不了, 需要用 $\varepsilon - N$ 语言证)

$$\forall 0 < \varepsilon < 1, \text{ 有 } 0 < \sin\left(\frac{\pi}{2} - \varepsilon\right) < 1, \text{ 所以}$$

$$\begin{aligned}
0 &< \int_0^{\frac{\pi}{2}} \sin^n x dx = \int_0^{\frac{\pi}{2} - \varepsilon} \sin^n x dx + \int_{\frac{\pi}{2} - \varepsilon}^{\frac{\pi}{2}} \sin^n x dx < \int_0^{\frac{\pi}{2} - \varepsilon} \sin^n x dx + \int_{\frac{\pi}{2} - \varepsilon}^{\frac{\pi}{2}} 1 \cdot dx \\
&= \sin^n\left(\frac{\pi}{2} - \varepsilon\right) \cdot \left(\frac{\pi}{2} - \varepsilon\right) + \varepsilon < \frac{\pi}{2} \cos^n \varepsilon + \varepsilon
\end{aligned}$$

为使 $\frac{\pi}{2} \cos^n \varepsilon < \varepsilon$, 只需

$$\cos^n \varepsilon < \frac{2\varepsilon}{\pi} \Rightarrow n \ln \cos \varepsilon < \ln \frac{2\varepsilon}{\pi} \Rightarrow n > \frac{\ln \frac{2\varepsilon}{\pi}}{\ln \cos \varepsilon}$$

(注意, $\ln \frac{2\varepsilon}{\pi} < 0, \ln \cos \varepsilon < 0$)

取 $N = \left\lceil \frac{\ln \frac{2\varepsilon}{\pi}}{\ln \cos \varepsilon} \right\rceil + 1$, 则当 $n > N$ 时, 恒有 $\frac{\pi}{2} \cos^n \varepsilon < \varepsilon$, 于是

$$0 < \int_0^{\frac{\pi}{2}} \sin^n x dx < \frac{\pi}{2} \cos^n \varepsilon + \varepsilon < \varepsilon + \varepsilon = 2\varepsilon$$

由 ε 的任意性知

$$\lim_{n \rightarrow \infty} \int_0^{\frac{\pi}{2}} \sin^n x dx = 0$$

($\int_0^{\frac{\pi}{2}} \sin^n x dx$ 不能直接用定积分中值公式去积分号 (因为若用定积分中值公式

$\int_0^{\frac{\pi}{2}} \sin^n x dx = \frac{\pi}{2} \sin^n \xi_n$, 其中 $\sin \xi_n$ 有可能趋于 1, 这样 $\sin^n \xi_n$ 是 1^∞ 型不定式无法计

算), 与 $\int_0^{\frac{\pi}{2}} \sin^n x dx$ 不同, $\int_0^{\frac{\pi}{2}-\varepsilon} \sin^n x dx$ 可以用定积分中值公式

$\int_0^{\frac{\pi}{2}-\varepsilon} \sin^n x dx = \left(\frac{\pi}{2} - \varepsilon\right) \sin^n \xi_n$, 这样就可以避免 $\sin \xi_n$ 趋于 1 的情况发生, 于是有

$\lim_{n \rightarrow \infty} \int_0^{\frac{\pi}{2}-\varepsilon} \sin^n x dx = \left(\frac{\pi}{2} - \varepsilon\right) \lim_{n \rightarrow \infty} \sin^n \xi_n = 0$, 而 $\int_{\frac{\pi}{2}-\varepsilon}^{\frac{\pi}{2}} \sin^n x dx < \int_{\frac{\pi}{2}-\varepsilon}^{\frac{\pi}{2}} 1 \cdot dx = \varepsilon$, 故

$0 \leq \lim_{n \rightarrow \infty} \int_0^{\frac{\pi}{2}} \sin^n x dx \leq \varepsilon$, 由 ε 的任意性知 $\lim_{n \rightarrow \infty} \int_0^{\frac{\pi}{2}} \sin^n x dx = 0$)

9. 设 $I_n = \int_0^1 \frac{x^n}{1+x} dx, n=1, 2, \dots$, (1) 求极限 $\lim_{n \rightarrow \infty} n I_n$; (2) 求极限 $\lim_{n \rightarrow \infty} \sum_{k=1}^n \frac{(-1)^k}{k}$.

解 (1) 因为

$$I_n + I_{n+1} = \int_0^1 \frac{x^n}{1+x} dx + \int_0^1 \frac{x^{n+1}}{1+x} dx = \int_0^1 \left(\frac{x^n}{1+x} + \frac{x^{n+1}}{1+x} \right) dx = \int_0^1 x^n dx = \frac{1}{n+1}$$

又

$$I_n = \int_0^1 \frac{x^n}{1+x} dx \geq \int_0^1 \frac{x^{n+1}}{1+x} dx = I_{n+1}$$

所以

$$2I_{n+1} \leq I_n + I_{n+1} = \frac{1}{n+1} \leq 2I_n$$

于是

$$\frac{1}{2(n+1)} \leq I_n \leq \frac{1}{2n} \Rightarrow \frac{n}{2(n+1)} \leq nI_n \leq \frac{1}{2}$$

而 $\lim_{n \rightarrow \infty} \frac{1}{2} = \frac{1}{2}$, $\lim_{n \rightarrow \infty} \frac{n}{2(n+1)} = \frac{1}{2}$, 由两边夹挤定理知

$$\lim_{n \rightarrow \infty} nI_n = \frac{1}{2}$$

(2) 因为

$$\sum_{k=0}^{n-1} (-1)^k x^k = \frac{1 \cdot [1 - (-1)^n]}{1 - (-x)} = \frac{1}{1+x} + (-1)^{n+1} \frac{x^n}{1+x}$$

积分得

$$\begin{aligned} \int_0^1 \left(\sum_{k=0}^{n-1} (-1)^k x^k \right) dx &= \int_0^1 \left[\frac{1}{1+x} + (-1)^{n+1} \frac{x^n}{1+x} \right] dx \\ \Rightarrow \sum_{k=0}^{n-1} (-1)^k \int_0^1 x^k dx &= \int_0^1 \frac{1}{1+x} dx + \int_0^1 (-1)^{n+1} \frac{x^n}{1+x} dx \\ \Rightarrow \sum_{k=0}^{n-1} \frac{(-1)^k}{k+1} &= \ln 2 + (-1)^{n+1} \int_0^1 \frac{x^n}{1+x} dx \\ \Rightarrow \sum_{k=1}^n \frac{(-1)^{k-1}}{k} &= \ln 2 + (-1)^{n+1} I_n \end{aligned}$$

由于

$$\frac{1}{2(n+1)} \leq I_n \leq \frac{1}{2n}$$

而 $\lim_{n \rightarrow \infty} \frac{1}{2n} = 0$, $\lim_{n \rightarrow \infty} \frac{1}{2(n+1)} = 0$, 由两边夹挤定理知 $\lim_{n \rightarrow \infty} I_n = 0$, 故

$$\lim_{n \rightarrow \infty} \sum_{k=1}^n \frac{(-1)^{k-1}}{k} = \ln 2 + \lim_{n \rightarrow \infty} (-1)^{n+1} I_n = \ln 2 + 0 = \ln 2$$
